Introduction

This document contains the surveyed cross-sectional profiles of all PHABSIM (physical habitat simulation software computer program) transects. There are 117 transects in the four study area basins, including 30 transects on North Fork Koktuli River (NFK), 43 transects on South Fork Koktuli River (SFK), 40 transects on Upper Talarik Creek (UT), and four transects on Mainstem Koktuli River (KR). One transect (i.e., 08-NFK2-MS1-TR2) is represented by two separate transect profiles: one for the left channel and one for the right channel. The transect cross-sectional profiles are organized by basin (NFK, SFK, UT, and KR), then by reach/tributary (e.g., NFK-A, NFK-B, NFK-C, NFK 1.190), followed by River Kilometer (RK) in ascending order (from the downstream most transect to the upstream most transect). The RK in the NFK and SFK basins is measured from the confluence of the NFK and SFK; RK in the UT basin is measured from Iliamna Lake; RK in the KR basin is measured from the Swan River; and RK in each tributary is measured from the mainstem river in each respective basin (i.e., NFK, SFK, and UT).

Each transect was visited multiple times, and during each visit, a full transect profile or a portion of the transect profile was surveyed. The transect profile plots include the measured bathymetry from all of the surveys, except the ones impacted by ice during the 2007 survey.

A winter low flow survey was conducted in April of 2007. During the site visit, many transects were still covered in ice, under deep snow, had anchor ice in the channel, or had fallen ice on waters edge. The hydraulics of those transects impacted by ice were significantly different from the ice-free flow conditions. Due to the ice effect, most transects from the winter low flow survey were not included in the hydraulic modeling and, as the result, the profiles of those transects are not presented in the transect cross-sectional plots.

Hydraulic Model Calibration Details

ACRONYMS AND ABBREVIATIONS

%	percent
A	flow area
AP	angle point or angle pin
Ave	average
BM	benchmark
cfs	cubic feet per second
EBD	Environmental Baseline Document
Fr	Froude number
ft	feet
g	gravity acceleration
GPS	global positioning system
HP	head pin
HP-x	head pin elevation for transect x, where x is the transect number
KR	Koktuli River mainstem
LC	left channel, looking downstream
NFK	North Fork Koktuli River
PHABSIM	Physical Habitat Simulation
Q	flow
QA	quality assurance
QC	quality control
Qmeasured	measured flow
Qmodel	modeled flow
Qlow	measured low flow
Qmid	measured mid flow
Qhigh	measured high flow
RC	right channel, looking downstream
RK	river kilometer
RMOD	roughness modifier
SFK	South Fork Koktuli River
SQRT	square root
Sta	station
SZF	stage of zero flow
T	wetted width
TP	turning point or tail pin
TR	transect
TR-x	transect x, where x is the transect number

UT	Upper Talarik Creek
VAF	velocity adjustment factor
V	velocity
V_ave	transect average velocity
WSE	water surface elevation
WP	wetted perimeter
WUA	weighted usable area
XS	cross-section

Introduction

This attachment describes the PHABSIM (physical habitat simulation software computer model) model calibration procedures and details pertaining to the instream flow transects established in the Pebble Project study area from 2004 through 2008. There were 138 PHABSIM transects originally set up over the 2004 through 2008 data collection period in the four study area basins: North Fork Koktuli River (NFK), South Fork Koktuli River (SFK), Upper Talarik Creek (UT), and Mainstem Koktuli River (KR). These transects included 38 transects on the NFK and the Tributary 1.190 (NFK 1.190), 46 transects on the SFK and the Tributary 1.190 (SFK 1.190), 49 transects on the UT and the Tributary 1.190 (UT 1.190), and five transects on the KR. Each stream was further divided into multiple reaches based on basin characteristics, channel morphology, water temperature, and hydrologic considerations, as described in the Pebble Project Environmental Baseline Document, Appendix 15.1B. Table 1 summarizes the number of PHABSIM transects in each reach/basin and the calendar year in which each transect was initially established.

During a multi-level rigorous data QA/QC process of all transect data, 21 of the 138 transects were identified as having significant bed profile changes over the data collection period. Thus, these 21 transects (Table 2) were removed from the PHABSIM analysis to ensure the reliability of hydraulic modeling for the remaining 117 transects (Table 3). Of these 117 transects, 30 were located on the mainstem NFK and NFK 1.190, 43 were located on the mainstem SFK and SFK 1.190, 40 were located on the mainstem UT and UT 1.190, and four were located on the mainstem KR, as depicted in Table 3.

This document contains two primary components:

- Hydraulic calibration methods (a description of the calibrations methods used, following procedures outlined in the PHABSIM reference manual [Milhous et al., 1989] and the "Tutorials for the Physical Habitat Simulation System" [Milhous et al., 1990]); and

- Hydraulic calibration details specific to each of the 117 transects for which hydraulic modeling was conducted (this component also includes a description of the types of data/details that are presented for each modeled transect).

Hydraulic Calibration Method

The calibration process followed the procedures outlined in the PHABSIM reference manual (Milhous et al., 1989) and the "Tutorials for the Physical Habitat Simulation System" (Milhous et al., 1990). The hydraulic calibration included two steps: water surface elevation (WSE) calibration and velocity calibration. The former step was used to ensure that calibration errors (i.e., the difference between measured and calibrated WSEs) were within an acceptable range and that the calibrated WSE~Q rating curve was reliable. The latter step was used to ensure that the calibrated velocity profile accurately reflected the hydraulic condition of the measured flow.

Water Surface Elevation Calibration

There are four methods suggested in the PHABSIM reference manual (Milhous et al., 1989) for hydraulic modeling to calibrate WSE, including IFG4, MANSQ, WSP, and HEC-2 (superseded by HEC-RAS, both developed by U.S. Army Corps of Engineers). The PHABSIM reference manual indicated the techniques used to simulate the hydraulic condition can have a significant impact on habitat vs. flow relationships.

Therefore, the calibration results from any of the four methods were examined carefully to ensure the simulation results were hydraulically correct.

Table 1.
Total number of PHABSIM transects in each basin. There were 138 transects established during the 2004-2008 data collection period, including 117 transects used in hydraulic modeling and 21 transects removed from the modeling due to significant bed profile change.

Basin Name	Reach	2004	2005	2006	2007	2008	All Years	Basin
Koktuli River	KR	5					5	5

	UT-C [a]		5				5	
Total Transect Count		27	37		7	46	117	117

Note:

a. Transects located in tributaries NFK 1.190, SFK 1.190, and UT 1.190 are within reaches NFK-C, SFK-B, and UT-C, respectively.

Of the 117 PHABSIM transects in the four basins, all but eight transects had three or more pairs of measured water surface elevations (WSEs) and flows available for calibration. The other eight transects had only two pairs each. The IFG4 model was always selected first for WSE calibration for the transects with three or more pairs of measured WSE~Q, and the MANSQ model was first selected for the other eight transects. If the initial model calibration failed to produce reasonable hydraulics, then other models were tried until reasonable modeled hydraulic conditions were achieved.

There were 30 simulation flows selected in the hydraulic modeling for developing a WSE~Q rating curve, as illustrated in Figure 1. The flows selected were designed to capture the variation of the habitat:flow relationship including the maximum habitat value. All measured flows were included in the 30 simulation flows in order to make a direct comparison of measured and calibrated WSEs. The lowest and highest simulation flows selected were 0.4 times the lowest measured flow and 2.5 times the highest measured flow, respectively.

After the WSE~Q rating curve was obtained, six hydraulic parameters (see below) associated with each flow on the rating curve were calculated to determine if the hydraulic calibrations were acceptable:

1. **WSE calibration errors.** These are the differences between calibrated WSEs and measured WSEs. The goal of calibration was to minimize the differences. The acceptable range for the errors was considered to be less than 0.10 ft. Calibration was considered to be only marginally acceptable if the errors were between 0.10 ft and 0.15 ft. Errors greater than 0.15 ft were considered to be unacceptable.

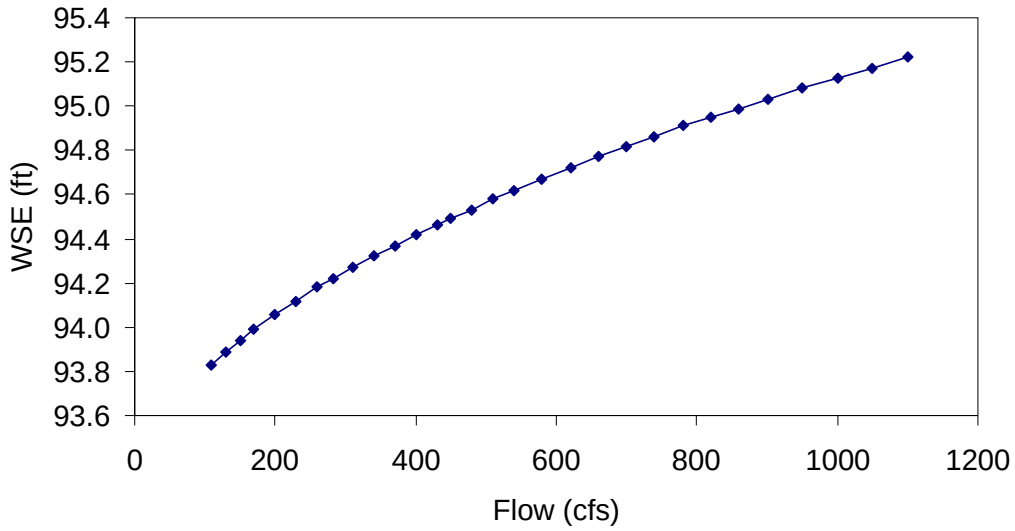

Figure 1.
WSE~Q rating curve developed from WSE calibration hydraulic modeling. There are 30 flows on the rating curve.

Among the 117 PHABSIM transects, there were 105 transects with calibration errors less than 0.05 ft, seven transects with calibration errors within 0.10 ft, and only five transects with marginally acceptable errors. None of the transects had calibration errors in the unacceptable range. Table 4 summarizes the number of transects in each river reach for each range of calibration error.

2. **Froude number (Fr).** The Froude number (Fr=V_ave/Sqrt(g*A/T), where g is gravity acceleration, A is flow area, T is wetted width; Chow, 1959) is expected to increase with increasing flows and should be below 1.0 for a natural stream with mild channel slope. All 117 transects, with the exception of the five on Tributary UT 1.190, had gentle channel slopes, and sub-critical flow conditions (i.e., Froude number less than 1.0) were expected from the hydraulic modeling results. The channel slopes of Tributary UT 1.190 were relatively steep, at about 1.2% to 1.4%, and super-critical flow conditions (i.e., Froude number greater than 1.0) were considered to be possible at higher flows.

3. **Manning's n values**. Manning's n values were calculated for each simulation flow using the IFG4 output and an utility program that accounted for flow, channel slope, wetted perimeter, hydraulic radius, and flow conveyance area. Manning's n values reflect the roughness of the channel. At lower flows when water surface elevation is low, the wetted channel boundary is relatively rough and higher Manning's n values would be expected. As flow increases and water surface elevation rises, the wetted channel boundary becomes smoother and Manning's n decreases. In general, Manning's n values should decrease with increasing flows. However, exceptions may occur under complex flow conditions.

4. **Velocity Adjustment Factor (VAF).** The VAF is an index of the ratio of simulation flow to the flow calculated by the IFG4 model. The index usually mirrors the trend of Manning's n values vs. flows, and therefore, VAFs are expected to increase with increasing flows. However, exceptions may occur under complex flow conditions.

5. **Average velocity (V_ave).** As flows increase, the average velocity, V_ave, of the transect should also increase.

Table 4.
Number of transects in each river reach for each range of calibration error. The majority of transects had calibration errors of 0.05ft or lower. No transects had errors greater than 0.15ft.

Basin	River Reach	WSE calibration error (ft)			
		≤ 0.05	0.06 - 0.10	0.11 - 0.15	> 0.15
North Fork Koktuli River	NFK-A	12	1	0	0
	NFK-B	4	0	1	0
	NFK-C	7	1	1	0
	NFK-C [a]	3	0	0	0
South Fork Koktuli River	SFK-A	18	1	0	0
	SFK-B	10	1	1	0
	SFK-C	4	1	1	0
	SFK-B [a]	6	0	0	0
Upper Talarik Creek	UT-B	5	0	0	0
	UT-C	7	0	0	0
	UT-D	7	0	0	0
	UT-E	9	1	0	0
	UT-F	5	0	1	0
	UT-C [a]	5	0	0	0
Koktuli River	KR	3	1	0	0
Total		105	7	5	0

Note:

a. Transects located in tributaries NFK 1.190, SFK 1.190, and UT 1.190 are within reaches NFK-C, SFK-B, and UT-C, respectively.

6. **Wetted perimeter (WP).** Wetted perimeter is the cumulative length along the wetted portion of the transect boundary, as illustrated in Figure 2. Because water level always increases with increasing flows, the wetted perimeter also increases with flows.

Each of the six hydraulic parameters was plotted against the simulation flows, as illustrated in Figure 3. All six parameters were checked carefully to ensure the quality of the calibration, and justifications were provided if any exceptions were found.

The programs IFG4 or MANSQ alone, however, may not be able to adequately model the hydraulic behavior for the entire range of simulation flows under certain hydraulic conditions. Such flow conditions may occur for a transect with simple or complex bathymetry. Depending on the nature of the issues associated from the IFG4/MANSQ modeling results, different measures can be taken to resolve the issues.

A channel with a floodplain which is dry at lower flow but inundated at higher flow may need a two-stage calibration. The first stage is to model the hydraulics below the floodplain and the second above the floodplain. A composite rating curve developed using the calibration results of the two stages is used to represent the entire range of simulation flows.

For a site with multiple transects and with elevations tied to the same vertical datum, the step backwater method, such as WSP and HEC-RAS, should be applied if the IFG4/MANSQ models fail to produce reasonable hydraulics.

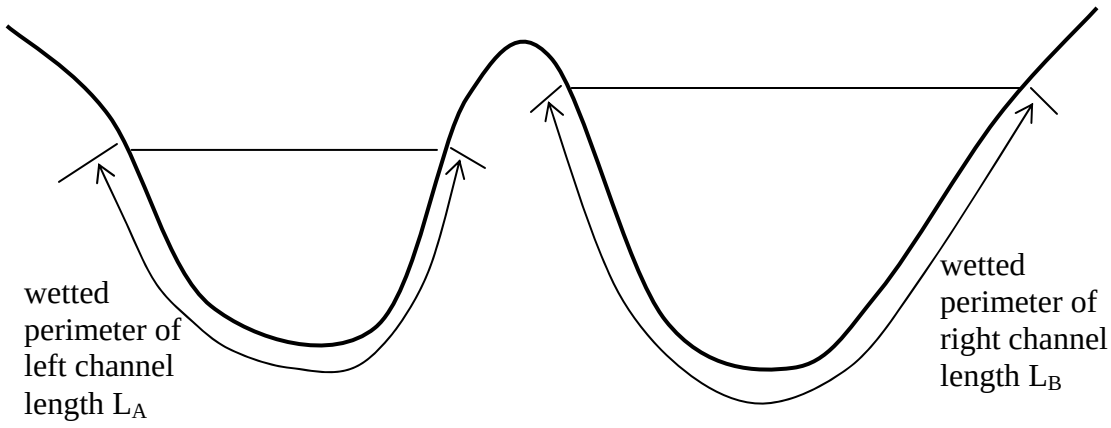

Figure 2.
Illustration of the wetted perimeter of a transect. The wetted perimeter of the transect is L_A+L_B.

Island complex habitat transect WSE modeling

An island complex transect has two or more channels: a main channel that conveys the majority of the flow and a side channel(s) that conveys less water. The water surface elevation of each channel may be significantly different, as illustrated in Figure 2. In this study, some island complex transects have more than 0.4 ft of WSE difference between main and side channels. All of the four hydraulic models (i.e., IFG4, MANSQ, WSP, HEC-RAS), however, are one-dimensional and require a single WSE in all channels across the transect. One of the goals of doing hydraulic calibration is to maintain the accuracy of the measured hydraulics, such as flow conveyance area, wetted perimeter, and Manning's n for the calibration flow. To meet this goal and the one-dimensional requirement, the bathymetry of side channel needs to be adjusted: the wetted portion of side channel is elevated (or lowered) by the WSE difference between the main channel and the side channel if the side channel has a lower (or higher) WSE. After elevating (or lowering) the bed, as illustrated in Figure 4, the WSEs in all channels across the transect become the same. The IFG4 model is usually used for WSE calibration for island complex transects. This is because IFG4 is simply an empirical equation that does not account for the complex processes associated with flow around islands.

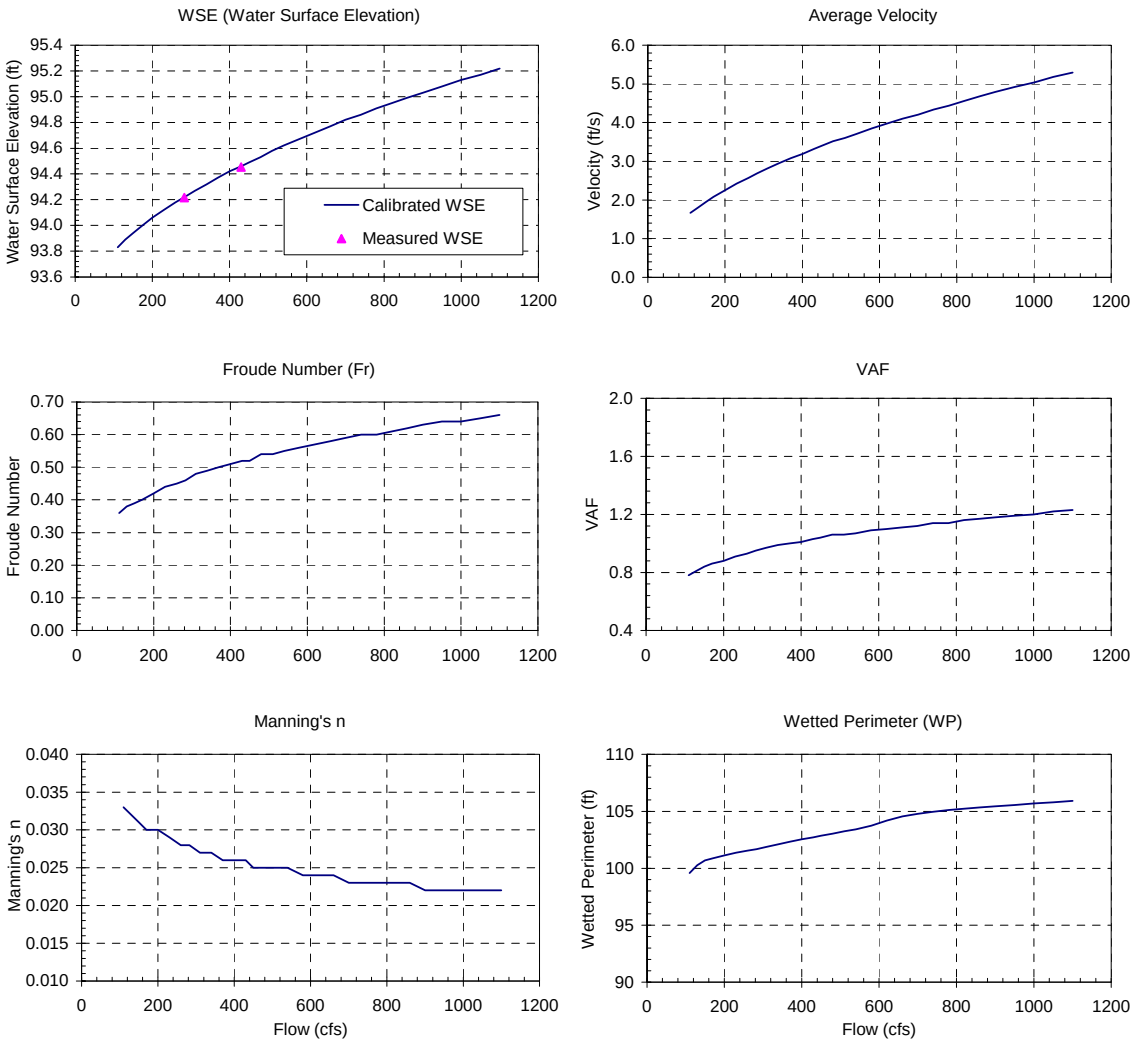

Figure 3.
Hydraulic parameters from hydraulic modeling. All six parameters are checked to ensure the calibration results are hydraulically correct.

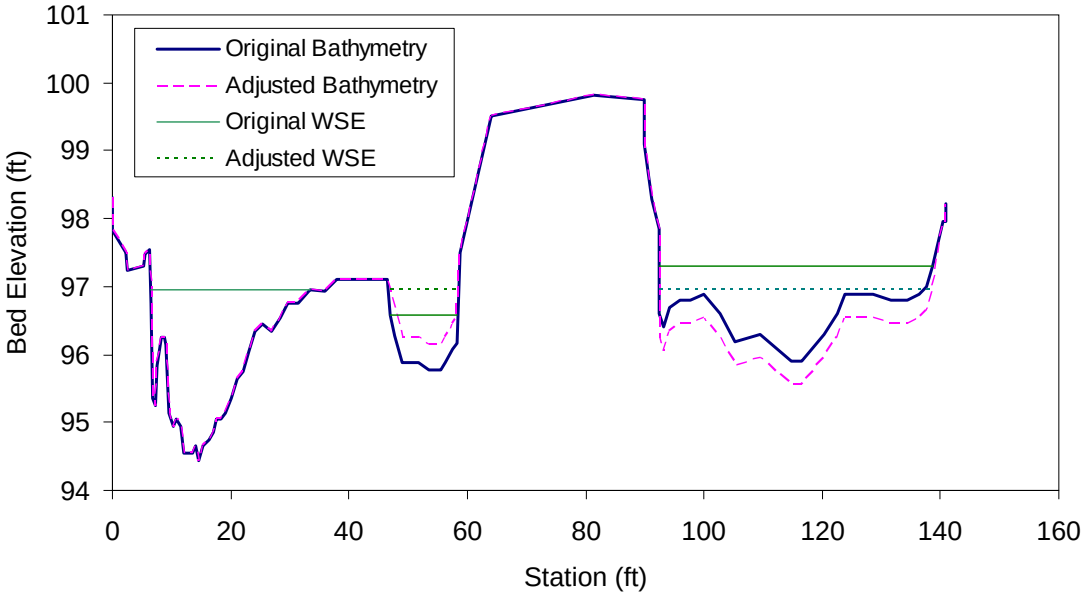

Figure 4.
An illustration showing the adjustment of bathymetry for the transect with multiple channels to meet the requirement of same water surface elevation in each channel across the transect. The thick solid line is the measured bed profile, and the dashed line is the adjusted bed profile. The thin horizontal lines are the measured WSEs in each channel, and the dotted horizontal lines are the WSEs after the bed profile adjustment is made and they are at the same elevation in all three channels.

Velocity Calibration

Velocity calibration is used to ensure the calibrated velocity profile resembles the measured profile with similar velocity distribution. This is generally done by making adjustments to the "cell roughness" calculated by the IFG4 model. The simulation velocity profiles of all measured flows were calibrated, and each of the calibrated velocity profiles was used as a velocity template by the habitat model to calculate habitat area for a range of flows in the vicinity of each measured flow.

It should be noted that each calibrated velocity profile is used by the habitat model to calculate habitat area for only a portion (i.e., sub-range) of the 30 simulation flows on the rating curve. As a result, the simulation velocity profile of each measured flow is only calibrated to predict the velocities for the portion of simulation flows that the habitat model will use for habitat area calculation.

For example: A transect has two velocity profiles measured at Q_{low}=280 cfs and Q_{high}=430 cfs, and the simulation flows range from 112 cfs to 1100 cfs. The Q_{low} velocity profile is calibrated to predict velocities for flows between 112 cfs and 430 cfs, and the Q_{high} velocity profile for flows between 280 cfs and 1100 cfs. The two calibrated velocity profiles are individually used for habitat area simulation. Then the two habitat area:flow relationships are blended to become a composite curve. Please refer to Appendix 15.1C, Attachment 2 for more details about the development of the transect composite WUA (weighted usable area).

Hydraulic Calibration Details

The PHABSIM model calibration details for each of the 117 transects are presented in the pages that follow. There was a large amount of detailed hydraulic information resulting from the model calibration for each transect. These details were critical for assessing the quality of the model and thus, are summarized in a series of tables, figures, and notes specific to each transect. The transects are organized by reach/tributary (e.g., NFK-A, NFK-B, NFK-C, NFK 1.190), followed by River Kilometer (RK) in ascending order (from the downstream most transect to the upstream most transect).

The details provided for each transect are as follows.

Field Data

1. Level loop survey results: The accuracy of ground and water surface elevation surveys depends on the stability of vertical and horizontal control pins. Elevation control points used during the level loop surveys included: benchmarks (BM), head pins (HP), tail pins or turning points (TP), and angle pins or angle points (AP). BM elevations were arbitrarily established at 100 feet, and elevations of all other control pins/points (HP, TP, and AP) were measured to the nearest hundredth of a foot relative to the BM elevation. Level loop surveys results from all site visits were summarized. The surveyed ground and water surface elevations were adjusted if the BM datum was disturbed and the disturbance could be quantified.
2. Measured WSE: Surveyed water surface elevations from all site visits were summarized in this section. For an island complex transect, the water surface elevation of each channel was listed in the WSE summary table and a note was given to indicate which water surface elevation was used in hydraulic modeling. Usually the main channel WSE was used for hydraulic modeling.
3. Discharge: Measured discharges of the transects from all site visits were summarized in this section. For an island complex transect with multiple channels, the measured flows of each channel were listed in the discharge summary table. Total discharge of the transect was also included and was used for hydraulic modeling.
4. Longitudinal WSE slope: Longitudinal WSE slope surveys were summarized in this section. The sites established prior to 2008 had only one transect, and the WSEs were surveyed at three locations in the vicinity of the transect, including at the transect and upstream and downstream of the transect. The longitudinal slope was surveyed during each of the site visits and the slopes from the multiple surveys were generally similar. For hydraulic modeling, the slope from the first flow measurement was used. Each of the sites established in 2008 all had multiple transects and the distances between adjacent transects were generally less than 200 ft or 60 m. Due to the proximity of the transects (except for Site 08-NFK2-MS1), the slope of each transect within the site was assumed the same and was equal to the average slope between TR-1 and the last transect of the site. Site 08-NFK2-MS1 had three transects which were far apart, with 1.5 kilometers between TR-1 and TR 2 and 3/4 kilometer between TR-2 and TR-3. No longitudinal slope was surveyed due to the long distance between transects, and, as the result, the model default slope S=0.25% was assumed for this site for hydraulic modeling.
5. Stage of Zero Flow (SZF): SZF is the lowest water elevation for a transect to have flowing water and it is a physical parameter used in the empirical equation of IFG4 model. The SZF can not be

lower than the thalweg, the lowest elevation of the transect. For a site with multiple transects, the SZF of an upstream transect must be no less than the SZF of a transect located downstream.

WSE Calibration Data

A table was used to summarize the measured water surface elevations, calibrated water surface elevations, calibration errors, and the hydraulic models used for the hydraulic calibration of each transect. Additional information was sometimes presented in this section to show the process of developing composite WSE~Q rating curve for a transect with complex bathymetry.

Velocity Calibration Data

The number of measured velocity profiles used for velocity calibration for each transect and the steps needed to calibrate the simulated velocity profile to resemble the measured velocity profile were discussed in this section. Also a table was included to indicate which calibrated velocity profile was used to develop the habitat:flow relationship.

Hydraulic Calibration Results

Each of the six hydraulic parameters calculated from the modeling were discussed in this section. Justifications were given to explain any hydraulic anomalies. Specific model details are included in the sections that follow.

Transect Profile

Each transect profile was surveyed multiple times, and the bathymetry may have changed each time slightly due to survey technique, accuracy, errors, and/or stream dynamics. A representative measured transect profile was presented to show the morphology of the stream, such as stream width, number of channels (for island complex transect), and the bank slope. Station represents the distance, in feet, across the length of the transect.

Longitudinal WSE Profiles

Measured WSEs vs. river stations were plotted in this figure. For the sites and transects established prior to 2008, a positive Station value indicates the distance (in feet) upstream of the transect, and a negative Station value indicates the distance downstream of the transect; the location of the transect is indicated as Station=0. For sites set up in 2008, there were multiple transects at each site, and WSEs were surveyed at each transect. Thus, the Station value represents the distance (in feet) from the most downstream transect (TR-1).

Measured Flow (Q) vs. Measured WSE

Measured WSEs vs. flows were plotted in this figure. Each site/TR had multiple measurements of WSE~Q. The WSE~Q data in this figure only included the ones that were used in the final hydraulic modeling. Measured WSE~Q data with obvious errors were not used for the modeling and thus were not included in the plot.

Comparison of Calibrated and Measured WSEs

Measured WSEs and calibrated WSEs were plotted in this figure to aid in determining the hydraulic calibration quality.

Transect Hydraulic Parameters

The six hydraulic parameters from model calibration (as described in the Hydraulic Calibration Method section above) are summarized in tables and figures, including: (1) calibrated vs. measured WSEs or calibration errors, (2) Froude number, (3) Manning's n, (4) Vel_ave, (5) VAF, and (6) WP. Each of the six parameters was examined carefully to ensure the modeling results are hydraulically correct.

Transect Hydraulic Summary Plots

There were three graphs plotted for the transect hydraulics summary. Most of the information shown in these three graphs could be found from various sources depicted previously; nevertheless, they are presented here in a more compact format to summarize the hydraulic modeling. The top graph included Manning's n, Froude number, and wetted perimeter plots. The middle graph showed the transect profile along with the surveyed WSEs of each measured flow. The highest WSE in the middle graph was the simulated WSE of the highest simulation flow. The bottom graph showed the measured velocity profile of the calibration flow (thick line) along with the simulation profiles of other measured flows and the highest simulation flow. The calibrated velocity profile was the simulation profile of the calibration flow. All the other simulation velocity profiles were modeled after this calibrated profile. The calibration flow was the measured flow whose simulation velocity profile was calibrated to resemble the measured velocity profile.

IFG4/MANSQ/WSP Data Deck

An IFG4 data deck is the input text file used for hydraulic modeling. It includes measured hydraulics and stream characteristics of a transect, such as simulation flows, SZF, bathymetry, velocity profile, WSE~Q rating curve, bed substrates, and measured flows. The data deck can be directly used in DOS version 2.1 PHABSIM model or be imported into other models such as RHABSIM (Payne & Associates, 1998), PHABWin (Hardy, 2002), or PHABSIM for Windows (USGS, 2001) for direct use. A MANSQ data deck and/or WSP data deck may be included in this section if the IFG4 model was not used for WSE calibration. (Note: IFG4 is a computer model that uses the regression method to estimate stage-discharge rating curve and simulates velocity profiles for various flows. MANSQ is a computer model that calculates WSEs for various flows using surveyed transect profile and one pair of measured WSE and flow. WSP is a computer model that utilizes a standard step-backwater method to simulate WSEs of various flows for multiple cross-sections with the same elevation datum.)

Habitat Type: Island Complex

River Kilometer: 3.37

Stream: North Fork Koktuli River
Reach: A
Site: 05-NFK1-IC3
Habitat Type: Island Complex

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	AP
1st	6/26/2005	100.00	98.88	97.75
2nd	7/24/2005	100.00	98.89	97.76
3rd	8/13/2005	100.00	98.89	97.76
4th	7/5/2006	100.00	98.90	97.43
5th	4/13/2007	100.00	98.87	97.79
6th	7/21/2007	100.00	98.87	97.75

(a) Control pin (BM, HP, AP) elevations are taken from the first half of each level loop survey
(b) Relative elevation changes between BM and HP were within ± 0.02ft. The small relative elevation changes suggested the BM was stable over the 2005-2007 survey period.

Measured WSE:

There are three WSEs measured across the main (Right) channel for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)		
	Left	Center	Right (main)
6/26/2005	94.28	94.67	95.41
7/24/2005	99.36	99.55	95.26
8/13/2005	94.11	94.59	95.06
7/5/2006	94.28	94.72	95.38
4/13/2007	95.58		97.09
7/21/2007	94.31	94.62	94.99

Hydraulics of 4/13/07 survey was affected by ice.

calibration notes

Discharge:

All the measured discharges are listed in the following table.

Date	WSE (ft)			
	Left	Center	Right (main)	Total
6/26/2005	7.9	0.4	159.9	168.2
7/24/2005				
8/13/2005	0.5	-0.1	119.9	120.3
7/5/2006	0.8	0.0	171.8	172.6
4/13/2007				
7/21/2007	0.5	0.1	101.9	102.5

(1) No discharge was measured in 7/24/05 trip.

(2) 4/13/07: Field notes indicated water flowing on ice. Discharge was not measured.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Left Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/26/2005	NA	NA
7/24/2005	NA	NA
8/13/2005	NA	NA
7/5/2006	0.052%	97
4/13/2007	NA	NA
7/21/2007	0.069%	58.00

calibration notes

Right (main) Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/26/2005	0.537%	126.6
7/24/2005	0.680%	103
8/13/2005	0.526%	150.2
7/5/2006	0.680%	103
4/13/2007	0.556%	117.00
7/21/2007	1.258%	66.00

The slope S=0.537% of 6/26/05 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/26/2005	92.91
7/24/2005	
8/13/2005	93.46
7/5/2006	93.18
4/13/2007	
7/21/2007	93.29
Invert	93.46
SZF	93.46

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profiles were surveyed on 7/24/05 and 4/13/06

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/26/2005	168.2	95.41	95.41	0.00	MANSQ
2nd	7/24/2005		95.26			
3rd	8/13/2005	120.3	95.06	95.06	0.00	MANSQ
4th	7/5/2006	172.6	95.38	95.42	0.04	MANSQ
5th	4/13/2007		97.09			
6th	7/21/2007	102.5	94.99	94.99	0.00	MANSQ

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharge was measured on 7/24/05 when substrate was surveyed.
(d) No discharge measured in 4/13/07 trip due to ice in the channel.

8/7/08: Initial WSE calibration using IFG4 showed Fr did not increase with increasing flows.
The final WSE~Q rating curve was calibrated in multiple steps using MANSQ model.
A MANSQ model was first applied to calibrate flows from the lowest simulation flow (40cfs) to the second highest measured flow (168.2cfs). A second MANSQ model was then applied to calibrate flows from the second lowest flow (120.3fs) to the highest simulation flow (430cfs). The two rating curves were developed between 120.3cfs and 168.2cfs. The WSEs between the two flows are linearly interpolated using the difference between a flow and 120.3cfs or 168.2cfs as the weighting factor.
The following table lists the calculation procedures to derive the composite rating curve.

calibration notes

Simulation Flow (cfs)	(120.3) WSE (β=0.0)	(168.2) WSE (β=-1.5)	Composite WSE (ft)

420		95.71	95.71

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 102.5cfs to 172.6cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the four calibrated velocity profiles, no adjustment to the model-calculated n values was needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/26/2005	168.2	Y
7/24/2005		
8/13/2005	120.3	Y
7/5/2006	172.6	
4/13/2007		
7/21/2007	102.5	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges.
Manning's n and Fr are generally varying in normal trends with increasing flows, but within the range of the the four measured flows between 102cfs and 172cfs, the trends vary in the opposite direction. It is determined this is ok, because the transect has very complex bathymetry with islands separating the cross-section into multiple channels. The hydraulics (velocity and WSE) were generally different in each channel such that the flow did not meet the definition of uniform flow across a transect, a hydraulic condition required when applying Manning's equation. In addition, the Froude number was originally developed for single-channel transects and may not be applicable to multiple-channel transects. As the result, the Manning's n value and Fr calculated for the transect with multiple channels may not realistically reflect the bed roughness of each channel or adequately indicate the quality of hydraulic calibration for the multiple-channel transect.

TR2:	08-NFK1-MS1-TR2	**Habitat Type:**	Run	**River Kilometer:**	9.91
TR3:	08-NFK1-MS1-TR3	**Habitat Type:**	Run	**River Kilometer:**	9.94
TR4:	08-NFK1-MS1-TR4	**Habitat Type:**	Riffle	**River Kilometer:**	10.04
TR5:	08-NFK1-MS1-TR5	**Habitat Type:**	Riffle	**River Kilometer:**	10.06
TR6:	08-NFK1-MS1-TR6	**Habitat Type:**	Island Complex	**River Kilometer:**	10.10

Stream: NF Koktuli River
Reach: A
Site: 08-NFK1-MS1
Habitat Type:

(1) Field Data

Level Loop Surveys:

Date	BM1	BM2	BM3	BM4	BM5
6/21/2008	100.00	98.94	97.41		
7/19/2008	100.00	98.92	97.39	98.02	
8/19/2008	100.00	98.92	97.39	98.01	99.56

(a) Elevations of control pins (BM's) are taken from the first half of each level loop survey
(b) Relative elevation changes between surveys were within ±0.01ft
(c) Elevation control pins were stable for their small relative elevation changes during the survey period
(d) The level loops of all three surveys closed with errors no more than 0.01ft

Measured WSE:

There are multiple WSEs measured across the transect for each flow, and the average of the measured WSE is used as transect representative WSE for modeling.

	WSE (ft)							
	TR-1		TR-2	TR-3	TR-4	TR-5	TR-6	
Date	LC	RC					LC	RC
6/21/2008	94.78	95.08	95.85	96.00	97.05	97.31	97.56	97.95
7/19/2008	94.04	94.38	95.44	95.53	96.34	96.58	96.74	97.40
8/19/2008	93.59	94.13	95.18	95.24	95.97	96.20	96.28	97.18

Right WSEs of TR1 are used for hydraulic calibration because the right channel carries the majority of flow.
Right WSEs of TR6 are used for hydraulic calibration because the right channel carries the majority of flow.
TR5 WSEs of July and August surveys: Only left WSEs are used for calibration because the majority of water flowing through the left portion of the channel.

calibration notes

Discharge:

All measured discharges are summarized in the following table.

Date	Discharge (cfs)						
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	**Average**
6/21/2008	510.4			486.7		566.1	**521.1**
7/19/2008	245.5	252.9	229.4	227.0	235.8	229.0	**236.6**
8/19/2008	114.7	111.7	106.0	133.7	125.6	117.8	**118.2**

Average of measured flows of all transects is used as the representatve flow of the site for hydraulic calibration.
The flows shown above are the total flow of each transect that may include multiple channels.

Longitudinal WSE Slope:

Slopes are calculated using the measured WSEs and longitudinal distances. Distances between transects are estimated using GIS with the transect locations QC/QC'd in Dec, 2009.

TR	Distance between Transects(ft)					
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
LB	0.0	89.0	97.0	225.0	84.0	116.0
RB	0.0	119.0	78.0	363.0	92.0	110.0
Ave	0.0	104.0	87.5	294.0	88.0	113.0
Bank Dist.	0.0	104.0	191.5	485.5	573.5	686.5
Ch. Dist.	0.0	123.8	212.0	528.7	616.9	739.3

Bank Dist. (Bank Distance) is the average length between the headpin/tailpins (HP/TPs) of two transects.
Ch. Dist. (Channel Distance) is the length along the channel canterline between transects.
Use Channel Distance for longitudinal WSE slope estimate.

Date	Longitudinal WSE Slope (%) between TR-1 and					
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/21/2008	-	0.622%	0.432%	0.373%	0.361%	0.335%
7/19/2008	-	0.861%	0.542%	0.372%	0.357%	0.320%
8/19/2008	-	0.848%	0.524%	0.349%	0.336%	0.291%
GPS	-	-	-	-	-	-

Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.
The TR-5 slope S=0.361% of 6/21/2008 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Discharge (cfs)					
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/21/2008	92.48			94.60		95.11
7/19/2008	92.58	93.54	92.88	94.69	94.58	94.99
8/19/2008	92.63	93.63	92.89	94.77	94.65	94.88
Invert	92.63	93.63	92.89	94.77	94.65	95.11
SZF	92.93	94.73	94.73	94.77	94.95	95.11

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
SZF of the upstream transect must be no less than that of its downstream transect.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

(1) IFG4 was used for TR-1 through TR-5. For TR-6, a composite method was used to develop the WSE~Q rating curve.
(2) For TR-6 WSE calibration: WSEs simulated by IFG4 were higher than expected at flows greater than 750cfs, resulting in steep WSE slope between TR-5 and TR-6. To make the hydraulics more reasonable at higher Qs, it was decided to use MANSQ to simulate the WSE for flows greater than 750cfs. The final WSE~Q rating curve of TR-6 would be a composite one using the results from both IFG4 and MANSQ. Flows Q<=750cfs, the WSEs on the composite curve were from IFG4 results, and for Q>=750cfs, the WSEs on the composite curve were from MANSQ results. Details are shown in the following table.
(3) For MANSQ method, β=-0.25 was used.

calibration notes

Simulation Q (cfs)	TR-6 WSE(ft)		
	IFG4	MANSQ β=-0.25	compo-site
45	95.83	96.02	95.83

(a) WSE calibration error = calibrated WSE - measured WSE

(b) All calibration errors are less than 0.05ft, except the mid flow of TR-1.

(c) TR-1 is a complex islands with multiple channels. Water surface elevations are uneven across the transect due to fast-moving currents and surface waves which may have contributed errors to the surveyed WSEs.

(3) Velocity Calibration

This site has six transects with each transect having 2 or 3 velocity/discharge measurements.
TR-1, TR-4, TR-6 each has three complete velocity measurements and TR-2, TR-3, and TR-5 each has two measurements.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/21/2008	521.1	Y			Y		Y
7/19/2008	236.6	Y	Y	Y	Y	Y	Y
8/19/2008	118.2	Y	Y	Y	Y	Y	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results of TR-1, TR2, TR-3, and TR-5 show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all reasonable.
TR-4 and TR-6 have increasing Manning's n values with increasing flows at lower flow range.
Hydraulics of both transects are ok for the following reasons:
For TR-4: there is a small plateau on the right side of channel that has significant effect on the wetted perimeter as flow is less than 100cfs.
For TR-6: The transect has complex bathymetry with islands splitting the cross-section into multiple channels where standard Fr formula may not be applicable.

IFG4 Data Deck - TR6

Stream: North Fork Koktuli River

Reach: NFK-A

Site: 08-NFK1-MS2

TR1:	08-NFK1-MS2-TR1	**Habitat Type:**	Island Complex	**River Kilometer:**	12.87
TR2:	08-NFK1-MS2-TR2	**Habitat Type:**	Island Complex	**River Kilometer:**	12.89
TR3:	08-NFK1-MS2-TR3	**Habitat Type:**	Island Complex	**River Kilometer:**	12.96
TR4:	08-NFK1-MS2-TR4	**Habitat Type:**	Island Complex	**River Kilometer:**	13.06
TR5:	08-NFK1-MS2-TR5	**Habitat Type:**	Island Complex	**River Kilometer:**	13.08

Stream: NF Koktuli River
Reach: A
Site: 08-NFK1-MS2

(1) Field Data

Level Loop Surveys:

Date	BM1	BM2	BM3	BM4
6/22/2008	100.00	103.69	106.20	
7/20/2008	100.00	103.69	106.20	
8/20/2008	100.00	103.70	106.19	103.95

(a) Elevations of control pins (BMs) are taken from the first half of each level loop survey
(b) Relative elevation changes of the control pins were within 0.01ft.
(c) Elevation control pins were stable for their small relative elevation changes over the survey period
(d) The level loops of all three surveys closed with errors no more than 0.01ft

Measured WSE:

This is an island complex site with each transect having a right channel and a left channel.
There are multiple WSEs measured across each channel for each flow, and the average of the measured WSEs is used as transect representative WSE for modeling.

	Measured WSE (ft)									
	TR-1		TR-2		TR-3		TR-4		TR-5	
Date	LC	RC	LC	RC	LC	RC	LC	RC	LC	RC
6/22/2008	99.38	98.92	99.72	99.04	101.00	100.14	101.94	102.50	102.50	102.91
7/20/2008	98.79	98.65	99.09	98.75	100.54	99.83	101.40	102.18	101.89	102.60
8/20/2008	98.41	98.51	98.71	98.61	100.26	99.63	101.06	101.95	101.53	102.40

Left WSEs are used for hydraulic calibration modeling because left channels carry more water.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Flow Discharge (cfs)					Ave Q (cfs)
	TR-1	TR-2	TR-3	TR-4	TR-5	
6/22/2008		436.4	472.0	438.3		**448.9**
7/20/2008	205.0	207.9	227.9	204.2	226.8	**214.4**
8/20/2008	107.5	118.4	113.2	121.6	132.8	**118.7**

Average of measured flows is used as the site representative flow for hydraulic modeling.
The flows shown above are the total flow of each transect that includes right and left channels.

Longitudinal WSE Slope:

Slopes are calculated using the measured WSEs and longitudinal distances. Distances between transects are the actual lengths measured using a tape measure.

TR	Distances between Transects (ft)				
	TR-1	TR-2	TR-3	TR-4	TR-5
LB	0.00	76	202	323	90
RB	0.00	84	199	341	106.5
Ave	0.00	80	200.5	332	98.25
Station	0.00	80	281	613	711

Date	Average Slope (%) from TR-1				
	TR-1	TR-2	TR-3	TR-4	TR-5
6/22/2008	-	0.425%	0.578%	0.419%	0.439%
7/20/2008	-	0.375%	0.627%	0.426%	0.437%
8/20/2008	-	0.381%	0.660%	0.433%	0.440%

Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.
The TR-5 slope S=0.439% of 6/22/2008 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

	TR-1	TR-2	TR-3	TR-4	TR-5
6/22/2008		97.67	99.40	99.14	
7/20/2008	96.99	97.59	99.14	99.20	100.14
8/20/2008	97.06	97.36	99.21	99.26	100.03
Invert	97.06	97.67	99.40	99.26	100.14
SZF	97.06	97.67	99.40	99.40	100.14

(1) Transect invert is the lowest elevation of the cross-section

(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process. SZF of the upstream transect must be no less than that of its downstream transect.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

TR1:
IFG4 method resulted in Manning's n values increasing with increasing flows when Q <= Qhigh
MANSQ method with β=-0.00 resulted in more reasonable hydraulics.

TR2 & TR3:
IFG4 method resulted in increasing Manning's n values with increasing flows.
MANSQ method with positive β value would result in a more reasonable trend for Manning's n values, but the positive β would also result in Froude numbers decreasing with increasing flows.
WSP method was also employed to calibrate WSE using TR-1 WSE as the boundary condition.
The results showed Manning's n values increased with increasing flows.
Since all three methods resulted in the same conclusion that Manning's n values increased with increasing flows, it was decided IFG4 method results to be used for the hydraulic analysis for TR-2 and TR-3 due to the relatively easier application of the method.

TR4:
IFG4, MANSQ, and WSP were all used to compare the simulation results, and IFG4 produced the most reasonable trends of Fr and Manning's n values.

TR5:
IFG4 method resulted in increasing Manning's n values with increasing flows.
MANSQ method with positive β value would result in more reasonable trend for Manning's n values, but the positive β value would also result in Froude numbers decreasing with increasing flows.
WSP method was used to calibrate WSE using TR-4 WSE as the boundary condition. The results showed Manning's n values decreased with increasing flows.
The following table and graph show the relationship between the flows and the calibrated roughness modifiers (RMOD)

calibration notes

Q(cfs)	RMOD
45	1.066
60	1.058
80	1.049
100	1.043
118.7	**1.038**

7/20/2008	214.4	0.01	-0.01	-0.01	0.01	0.03	MANSQ	IFG4	IFG4	IFG4	IFG4
8/20/2008	118.7	0.05	0.00	0.00	-0.01	0.02	MANSQ	IFG4	IFG4	IFG4	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum calibration error 0.05ft is within the acceptable range

(3) Velocity calibration

This site has five transects and each transect has 2 or 3 velocity/discharge measurements.
TR-1 and TR-5 each has two discharge measurements and TR-2, TR-3, and TR-4 each has three discharge measurements.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model.
Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow.
The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)				
		TR-1	TR-2	TR-3	TR-4	TR-5
6/22/2008	448.9		Y	Y	Y	
7/20/2008	214.4	Y	Y	Y	Y	Y
8/20/2008	118.7	Y	Y	Y	Y	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.

The simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable range. V_ave (Average velocity) and WP (wetted perimeter) both increase with increasing flows, but Manning's n value, VAF, and Froude number of all five transects each show the opposite trends for at least a part of the simulation flow range.

Backwater program WSP was also employed for hydraulic calibration but produced the similar results for Froude Numbers and n values as IFG4 and MANSQ did. Hydraulic parameter, such as Froude Number, is generally defined for a single channel and may not be applicable to a complex bathymetry with islands dividing the cross-section into multiple channels.

The calibrated WSEs of the all five transects are summarized in the comparison of the calibrated and measured WSE figure, and they appear parallel to each other within the entire range of simulation flows, as expected for the transects separated by short distance without any hydraulic discontinuity, such as falls or structure, between any two transects.

Stream: North Fork Koktuli River

Reach: NFK-A

Site/TR: 05-NFK1-RN1

Habitat Type: Island Complex

River Kilometer: 13.23

Stream: North Fork Koktuli River
Reach: A
Site: 05-NFK1-RN1
Habitat Type: Island Complex

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	AP	HP	TP
1st	6/23/2005	100.00	100.22		102.04
2nd	7/24/2005	100.00	100.22		102.03
3rd	8/13/2005	100.00	100.22		102.05
4th	9/10/2005	100.00	100.22	101.32	
5th	7/3/2006	100.00	100.29	101.32	101.98
6th	7/5/2006		100.16	101.32	100.16
7th	4/13/2007				
8th	7/21/2007	100.00	100.02	101.30	101.91

(a) Elevations of control pins (BM, AP, HP, TP) are taken from the first half of each level loop survey
(b) 4/13/07 level loop survey had feet of snow on the control pins
(c) Relative elevation between pins indicated AP and TP were disturbed in 2006.
(d) Relative elevation change between BM and HP were within ±0.01ft from 2005 to 2007. Consistent relative elevation betwwen BM & HP suggests the BM was stable throughout the survey period.

calibration notes

Meaured WSE:

There are as many as three WSEs measured across each of main and side channels for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)			
	Left (side)	Back-water	Pool	Right (main)
6/23/2005			98.19	98.25
7/24/2005				98.07
8/13/2005			97.87	97.91
9/10/2005	98.68	98.72	98.93	99.08
7/3/2006	97.84	98.06	98.19	98.21
7/5/2006	97.85	97.89	98.01	98.05
4/13/2007				101.48
7/21/2007	97.59	97.64	97.80	97.92

A backwater channel and a left (side) channel were surveyed the first time on 9/10/05.
On 4/13/07 the site was under feet of snow, and the surveyed data were not used in modeling.

Discharge:

All measured discharges are listed in the following table.

Date	WSE (ft)				
	Left (side)	Back-water Ch	Pool	Right (main)	Total
6/23/2005	**17.4**	NM	0.0	207.1	224.5
7/24/2005					
8/13/2005	NM	NM	0.0	90.4	90.4
9/10/2005	62.8	NM	NM	NM	
7/3/2006					
7/5/2006	6.4	0.0	0.0	146.8	153.2
4/13/2007					
7/21/2007	3.2	0.0	0.0	90.6	93.8

(1) NM stands for discharge not measured
(2) No discharge measured for 7/24/05 and 7/3/06 trips when the substrate was surveyed
(3) Flow in left (side) channel of 6/23/05 survey is an estimated value from the following equation:
Q=6.4+(62.8-6.4)/(99.08-98.05)*(98.25-98.05)=6.4+10.95=17.4

calibration notes

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Left (Side) Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/23/2005		
7/24/2005		
8/13/2005		
9/10/2005	0.159%	150.8
7/3/2006	0.425%	112.9
7/5/2006	0.389%	95
4/13/2007		
7/21/2007	0.584%	65.1

Right (Main) Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/23/2005	0.163%	141.2
7/24/2005	0.128%	180
8/13/2005	0.150%	186.7
9/10/2005	0.253%	130.3
7/3/2006	0.131%	107
7/5/2006	0.170%	176.7
4/13/2007	0.143%	126
7/21/2007	0.082%	158.4

The slope S=0.163% of 6/23/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Right (main) Channel Invert (ft)	
6/23/2005	95.75	
7/24/2005		
8/13/2005	95.81	
9/10/2005		
7/3/2006	95.88	
7/5/2006	95.85	
4/13/2007	100.18	ice impact
7/21/2007	95.90	
Invert	95.90	
SZF	95.90	

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile surveyed in 7/24/05 and 9/10/05 trips
(4) Bed profile of April, 07 was affected by ice and not used to determine the SZF

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/23/2005	**224.5**	98.25	98.23	-0.02	IFG4
2nd	7/24/2005		98.07			
3rd	8/13/2005	90.4	97.91	97.90	-0.01	IFG4
4th	9/10/2005		99.08			
5th	7/3/2006		98.21			
6th	7/5/2006	153.2	98.05	98.09	0.04	IFG4
7th	4/13/2007		101.48			
8th	7/21/2007	93.8	97.92	97.91	-0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) Photos of 4/13/07 showed the channel was largely covered in ice. Hydraulic data not used for modeling.
(d) No discharges measured on 7/24/05 and 7/3/06. Partial discharge measureement on 9/10/05.

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 93.8cfs to 224.5cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the four calibrated velocity profiles of this transect, no adjustment for model-calculated n values was needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/23/2005	224.5	Y
7/24/2005		
8/13/2005	90.4	Y
9/10/2005		
7/3/2006		
7/5/2006	153.2	Y
4/13/2007		
7/21/2007	93.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends as flow increases.

Site: 07-NFK1-RF1
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Trip	Date	BM	HP	TP
1st	6/12/2007	100.00	98.83	100.09
2nd	7/20/2007	100.00	98.84	100.11
3rd	9/20/2007			
4th	10/19/2007	100.00	98.85	100.11

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) No level loop was conducted in the 9/20/07 site visit.
(c) Relative elevation changes of control pins were within ±0.01ft over the study period in 2007.
(d) Small elevation change suggests the control pins were stable during the survey period.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/12/2007	94.95
7/20/2007	94.72
9/20/2007	95.70
10/19/2007	95.06

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/12/2007	200.3
7/20/2007	104.6
9/20/2007	
10/19/2007	190.3

No discharge was surveyed during the 9/20/07 site visit.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/12/2007	0.743%	118.4
7/20/2007	0.711%	112.5
9/20/2007	0.582%	110
10/19/2007	0.727%	88

The slope S=0.743% of 6/12/07 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/12/2007	93.45
7/20/2007	93.52
9/20/2007	
10/19/2007	93.36
Invert	93.52
SZF	93.52

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in 9/20/07 trip

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/12/2007	200.3	94.95	94.95	0.00	IFG4
2nd	7/20/2007	104.6	94.72	94.72	0.00	IFG4
3rd	9/20/2007		95.70			
4th	10/19/2007	190.3	95.06			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Hydraulics of 10/19/07 were not used in WSE calibration because of too high WSE.
(c) No discharges measured in third trip on 9/20/2007

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 104.6cfs to 200.3cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment
of n values was made at the stations where simulated velocity was greatly different from the measured
values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/12/2007	200.3	Y
7/20/2007	104.6	Y
9/20/2007	0.0	
10/19/2007	190.3	

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends as flow increases.

IFG4 Data Deck

Stream: North Fork Koktuli River

Reach: NFK-B

Site/TR: 05-NFK1-IC1

Habitat Type: Island Complex

River Kilometer: 15.33

Stream: North Fork Koktuli River
Reach: B
Site: 05-NFK1-IC1
Habitat Type: Island Complex

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	AP	TP
1st	6/22/2005	100.00	98.27	98.58	100.21
2nd	7/23/2005	100.00	98.29		100.19
3rd	8/13/2005	100.00	98.28	98.59	100.20
4th	7/4/2006	100.00	98.27	98.59	100.23
5th	4/13/2007	100.00	98.25	98.56	
6th	7/20/2007	100.00	98.27	98.57	100.33

(a) Control pin (BM, HP, AP, TP) elevations are taken from the first half of each level loop survey
(b) Relative elevation changes between control pins were within ± 0.02ft, except TP.
The small relative elevation changes suggested the control pins were stable during the survey period.
(c) The disturbance to TP would not affect the survey results because all other three pins were stable.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the main channel for each flow,
and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)	
	Left	Right (main)
6/22/2005	95.61	96.93
7/23/2005	95.39	96.35
8/13/2005	95.31	96.39
7/4/2006	95.53	96.68
4/13/2007	96.41	97.82
7/20/2007	95.36	96.38

Hydraulics of 4/13/07 survey were affected by ice.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	WSE (ft)		
	Left	Right (main)	Total
6/22/2005	7.1	219.4	226.4
7/23/2005			
8/13/2005	-0.7	100.9	100.2
7/4/2006	0.1	148.1	148.2
4/13/2007	19.6	64.4	84.0
7/20/2007	1.0	93.2	94.1

(1) Hydraulics of 4/13/07 survey were affected by ice.
(2) No discharge was measured on 7/23/05

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope		WSE Slope	
	Left	Right (main)	Left	Right (main)
6/22/2005	0.057%	0.324%	121.8	139
7/23/2005	0.023%	0.292%	87.5	130.1
8/13/2005	0.030%	0.196%	99.9	132.7
7/4/2006	-0.01%	0.326%	85	110.4
4/13/2007				
7/20/2007	0.012%	0.243%	82	111

No WSE slope was measured in 4/13/07 trip
The slope S=0.324% of 6/22/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Main Channel Invert (ft)
6/22/2005	94.53
7/23/2005	
8/13/2005	94.49
7/4/2006	94.38
4/13/2007	94.21
7/20/2007	94.63
Invert	94.63
SZF	94.93

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profiles were surveyed on 7/23/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft)	calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR	TR	TR	
1st	6/22/2005	226.4	96.93	96.95	0.02	IFG4
2nd	7/23/2005		96.35			
3rd	8/13/2005	100.2	96.39	96.41	0.02	IFG4
4th	7/4/2006	148.2	96.68	96.65	-0.03	IFG4
5th	4/13/2007	84.0	97.82			
6th	7/20/2007	94.1	96.38	96.37	-0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) 7/23/05 data set has no discharge measurement
(d) Hydraulics of 4/13/07 survey was affected by ice in the channel. Data not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with five velocity/discharge measurements, ranging from 84cfs to 226.4cfs.
The April, 07 profile (84cfs) was impacted by ice and thus was not used for velocity calibration.
Each of the remaining four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow.
No adjustment for n values was needed for any of the four calibrated velocity profiles.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/22/2005	226.4	Y
7/23/2005		
8/13/2005	100.2	Y
7/4/2006	148.2	Y
4/13/2007	84.0	
7/20/2007	94.1	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter)
are all within reasonable ranges with normal trends.

IFG4 Data Deck

Stream: North Fork Koktuli River

Reach: NFK-B

Site/TR: 05-NFK1-RF2

Habitat Type: Riffle

River Kilometer: 15.97

Stream: North Fork Koktuli River
Reach: B
Site: 05-NFK1-RF2
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/22/2005	1	100.00	100.82	95.77
2nd	7/23/2005	2	100.00	100.83	95.74
3rd	8/14/2005	3	100.00	100.80	95.76
4th	7/4/2006	4	100.00	100.77	95.72
5th	4/13/2007	5	100.00	100.79	95.74
6th	7/19/2007	6	100.00	100.81	95.72

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevation changes between control pins were within ±0.03ft from 2005 to 2007.
(c) The relative changes indicated there were slight disturbance to the control pins over the 2+ years period. Not able to determine if the BM or the other two pins or all three had moved. The disturbance is not too significant and is not expected to have too significant impact on hydraulic calibration.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/22/2005	93.62
7/23/2005	93.36
8/14/2005	93.21
7/4/2006	93.49
4/13/2007	94.71
7/19/2007	93.13

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/22/2005	219.5
7/23/2005	
8/14/2005	110.0
7/4/2006	161.4
4/13/2007	36.1
7/19/2007	98.8

(a) No discharge was measured on 7/23/05

(b) Hydraulics of 4/13/07 survey was significantly affected by ice

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/22/2005	0.688%	125
7/23/2005	0.482%	230.4
8/14/2005	0.647%	166.8
7/4/2006	0.681%	133.7
4/13/2007	NA	
7/19/2007	0.639%	125.1

The slope S=0.688% of 6/22/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/22/2005	91.22
7/23/2005	
8/14/2005	91.41
7/4/2006	91.49
4/13/2007	92.61
7/19/2007	91.33
Invert	91.49
SZF	91.49

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in 7/22/05 trip
(4) April, 07 bed profile was affected by ice and was not used to determine the SZF

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/22/2005	219.5	93.62	93.66	0.04	IFG4
2nd	7/23/2005		93.36			
3rd	8/14/2005	110.0	93.21	93.20	-0.01	IFG4
4th	7/4/2006	161.4	93.49	93.44	-0.05	IFG4
5th	4/13/2007	36.1	94.71			
6th	7/19/2007	98.8	93.13	93.14	0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.05ft is within acceptable range.
(c) No discharge was measured on 7/23/05
(d) Photos of 4/13/07 showed the entire channel was almost completely covered in ice.
Measured hydraulics were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 98.8cfs to 219.5cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment
of n values was made at the stations where simulated velocity was greatly different from the measured
values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/22/2005	219.5	Y
7/23/2005		
8/14/2005	110.0	Y
7/4/2006	161.4	Y
4/13/2007	36.1	
7/19/2007	98.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter)
are all within reasonable ranges and appear to vary in normal trends as flow increases.

IFG4 Data Deck

Stream: North Fork Koktuli River

Reach: NFK-B

Site/TR: 05-NFK1-RF1

Habitat Type: Riffle

River Kilometer: 18.29

Stream: North Fork Koktuli River
Reach: B
Site: 05-NFK1-RF1
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	6/21/2005	100.00	101.50	100.20
2nd	7/22/2005	100.00	101.48	100.19
3rd	8/14/2005	100.00	101.45	100.18
4th	7/4/2006	100.00	101.42	100.19
5th	4/12/2007	100.00		100.22
6th	7/20/2007	100.00	101.40	100.20

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevation changes between control pins were within ±0.02ft, except HP.
Small elevation changes between BM and TP indicated BM was stable during the 2005-2007 period.
(c) The noticeable elevation change of 0.10ft in HP should not affect the accuracy of the level loops surveyed in 2007 because the elevations were referenced to BM, which was stable the entire period.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/21/2005	97.20
7/22/2005	96.97
8/14/2005	96.74
7/4/2006	97.01
4/12/2007	96.65
7/20/2007	96.73

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/21/2005	214.8
7/22/2005	
8/14/2005	96.9
7/4/2006	152.4
4/12/2007	84.4
7/20/2007	88.2

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/21/2005	0.470%	140.5
7/22/2005	0.495%	258.6
8/14/2005	0.500%	154
7/4/2006	0.475%	145.4
4/12/2007	0.493%	136
7/20/2007	0.548%	153.4

The slope S=0.470% of 6/21/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/21/2005	95.40
7/22/2005	
8/14/2005	95.44
7/4/2006	95.51
4/12/2007	95.55
7/20/2007	95.53
Invert	95.55
SZF	95.55

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/22/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/21/2005	214.8	97.20	97.22	0.02	IFG4
2nd	7/22/2005		96.97			
3rd	8/14/2005	96.9	96.74	96.74	0.00	IFG4
4th	7/4/2006	152.4	97.01	96.99	-0.02	IFG4
5th	4/12/2007	84.4	96.65	96.67	0.02	IFG4
6th	7/20/2007	88.2	96.73	96.70	-0.03	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured on 7/22/05
(d) 4/12/07 survey: photos showed hydraulics may have been slightly affected by ice in the channel. The WSE was a little higher on the regression curve. The impact was expected not too significant, so the data were still used in hydraulic calibration.

calibration notes

(3) Velocity calibration

This site has one transect with five velocity/discharge measurements, ranging from 84.4cfs to 214.8cfs.
Each of the five measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/21/2005	214.8	Y
7/22/2005		
8/14/2005	96.9	Y
7/4/2006	152.4	Y
4/12/2007	84.4	
7/20/2007	88.2	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends as flow increases.

Stream: North Fork Koktuli River
Site: 04-NFK-RF1
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Trip	Date	Trip	BM	HP	TP
1st	6/23/2005	1	100.00	98.41	98.59
2nd	7/23/2005	2	100.00	98.43	98.59
3rd	8/14/2005	3	100.00	98.40	98.59
4th	7/4/2006	4	100.00	98.45	98.62
5th	4/13/2007	5	100.00	98.39	98.65
6th	7/20/2007	6	100.00	98.49	98.65

Note : (a) Control pin elevations (BM, HP, TP) are taken from the first half of each level loop survey
(b) The maximum control pin relative elevation change was 0.09ft
(c) Control pins moved slightly from 2005 to 2006, but within ±0.02ft range.
No correction to the surveyed WSEs of 2006 was needed due to the small change..
(d) For 2007 level loops, based on the relative elevation change overtime, it is determined BM had moved lower by 0.06ft to 0.08ft since 2005. As the result, WSEs of 2007 were corrected by subtracting 0.06ft from the measured WSEs.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/23/2005	96.46
7/23/2005	96.19
8/14/2005	96.10
7/4/2006	96.27
4/13/2007	95.97
7/20/2007	96.09

The WSEs listed avove have reflected the 0.06ft correction to the 2007 WSEs.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/23/2005	169.2
7/23/2005	
8/14/2005	86.9
7/4/2006	129.4
4/13/2007	61.8
7/20/2007	86.0

No discharge was measured on 7/23/05

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/23/2005	0.645%	31
7/23/2005	0.511%	102
8/14/2005	0.607%	97
7/4/2006	0.566%	103
4/13/2007	0.361%	155
7/20/2007	0.552%	96

The slope S=0.645% of 6/23/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/23/2005	94.86
7/23/2005	
8/14/2005	94.90
7/4/2006	94.87
4/13/2007	94.87
7/20/2007	94.99
Invert	94.99
SZF	94.99

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/23/05
(4) 4/13/07 Survey: Photos showed channel was clear of ice. Though the ice on both banks was still thick, they should have no effect on hydraulics.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Trip	Survey Date	Q (cfs)	Measured WSE(ft) TR-1	Calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/23/2005	169.2	96.46	96.44	-0.02	IFG4
2nd	7/23/2005					
3rd	8/14/2005	86.9	96.10	96.10	0.00	IFG4
4th	7/4/2006	129.4	96.27	96.29	0.02	IFG4
5th	4/13/2007	61.8	95.97	95.96	-0.01	IFG4
6th	7/20/2007	86.0	96.09	96.10	0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range.
(c) No discharge was measured during the 7/23/05 site visit.

calibration notes

(3) Velocity calibration

This site has one transect with five velocity/discharge measurements, ranging from 61.8cfs to 169.2cfs.
Each of the five measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment
of n values was made at the stations where simulated velocity was greatly different from the measured
values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/23/2005	169.2	Y
7/23/2005		
8/14/2005	86.9	Y
7/4/2006	129.4	Y
4/13/2007	61.8	Y
7/20/2007	86.0	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter)
are all within reasonable ranges and appear to vary in normal trends as flow increases.

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP
1st	6/24/2005	100.00	99.16	100.66
2nd	7/22/2005	100.00	99.18	100.68
3rd	8/14/2005	100.00	99.17	100.66
4th	7/4/2006	100.00	99.09	100.58
5th	4/12/2007	100.00	98.86	100.34
6th	7/20/2007	100.00	98.88	100.21

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Both HP and TP were about 0.07ft lower in 2006 than in 2005, suggesting BM was 0.07ft higher in 2006, which may be due to frost heave. As the result, WSEs surveyed in 2006 should be corrected to the 2005 elevation datum by subtracting 0.07ft.
(c) Relative elevation changes between pins show both HP and TP were 0.28-0.30ft lower in 2007 than in 2005. This suggests BM was about 0.28ft higher in 2007 than in 2005. therefore, WSEs surveyed in 2007 should be corrected to the 2005 elevation datum by subtracting 0.28ft.

calibration notes

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/24/2005	97.65
7/22/2005	97.37
8/14/2005	97.14
7/4/2006	97.36
4/12/2007	96.92
7/20/2007	97.02

The WSEs of 2006 and 2007 in the above table have reflected the adjustments to the datum .
HI of 2006 is added 0.07ft to adjust to the datum of 2005
HI of 2007 is added 0.28ft to adjust to the datum of 2005

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/24/2005	146.2
7/22/2005	
8/14/2005	92.3
7/4/2006	117.9
4/12/2007	64.3
7/20/2007	79.6

No discharge was measured on 7/22/05 when substrate was surveyed

calibration notes

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/24/2005	0.436%	78.0
7/22/2005	0.385%	78.0
8/14/2005	0.419%	102.7
7/4/2006	0.410%	134.0
4/12/2007	0.419%	207.8
7/20/2007	0.465%	127.0

The slope S=0.436% of 6/24/05 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/24/2005	95.35
7/22/2005	
8/14/2005	95.44
7/4/2006	95.36
4/12/2007	95.47
7/20/2007	95.62
Invert	95.62
SZF	95.62

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/22/05

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

MANSQ was applied for WSE calibration, and β=0.0 was used in the calculation.
The calibration results are summarized in the following table.

Flow (cfs)	WSE (ft)
30.0	96.47
40.0	96.60
50.0	96.72
60.0	96.83
70.0	96.93
79.6	97.02
90.0	97.12
92.3	97.14
100.0	97.21
110.0	97.29
120.0	97.36
124.8	97.40
130.0	97.43
140.0	97.50
146.2	97.54
150.0	97.57
160.0	97.63
170.0	97.69
180.0	97.75
190.0	97.81
200.0	97.87
210.0	97.92

calibration notes

220.0	97.98
240.0	98.09
260.0	98.19
280.0	98.29
300.0	98.39
320.0	98.49
340.0	98.59
360.0	98.69

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR-1	Calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/24/2005	146.2	97.65	97.54	-0.11	MANSQ
2nd	7/22/2005					
3rd	8/14/2005	92.3	97.14	97.14	0.00	MANSQ
4th	7/4/2006	117.9	97.36	97.35	-0.01	MANSQ
5th	4/12/2007					
6th	7/20/2007	79.6	97.02	97.02	0.00	MANSQ

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) No discharge was measured during the 7/22/05 site visit.
(c) Photos showed the 4/12/07 channel was still affected by ice, and thus the surveyed hydraulics of this date was not included in the modeling.
(d) WSE calibration error of the highest measure flow is 0.11ft, which may be the result of the disturbance to the control pins. Different WSE calibration method (IFG4) was also tried, but MANSQ resulted in the most reasonable hydraulics within the range of simulation flows.

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 79.6cfs to 146.2cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/24/2005	146.2	Y
7/22/2005		
8/14/2005	92.3	Y
7/4/2006	117.9	Y
4/12/2007		
7/20/2007	79.6	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges.
The parameters appear to vary in normal trends as flow increases for the two transect profiles surveyed in 2005.
For the two transect profiles surveyed in 2006-2007 period, the parameters vary in opposite trends when the flow is less than the highest measured flows (146.2cfs), but stay virtually flat when the flows are higher than the highest measured flows. Comparison of the transect profiles surveyed in these two period shows aggradations near the left bank in each of the two later profiles.
The opposite trends of hydraulics may have been the result of the aggradation.

Stream: North Fork Koktuli River

Reach: NFK-C

Site/TR: 04-NFK-IC1

Habitat Type: Island Complex

River Kilometer: 22.26

Stream: North Fork Koktuli River
Reach: C
Site: 04-NFK-IC1
Habitat Type: Island Complex

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	Dogleg	TP
1st	6/23/2005	100.00	98.78	98.05	98.88
2nd	7/22/2005	100.00	98.76	98.07	98.88
3rd	8/14/2005	100.00	98.74	98.06	98.88
4th	7/4/2006	100.00	98.64	98.07	98.90
5th	4/13/2007	100.00	98.65	98.06	98.95
6th	7/19/2007	100.00	98.55		98.94

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Dogleg is a control pin located on the island.
(c) Relative elevation changes from the level loops surveys indicated HP and/or TP were disturbed in 2006, as compared to the BM elevation.
(d) Relative elevation changes between BM and Dodleg were within ±0.01ft from 2005 to 2007. Small relative elevation change suggests the two pins were stable throughout the survey period.

calibration notes

Measured WSE:

This transect is an island complex with a main channel and a side channel. Each channel has three measured WSEs (i.e., Right, Mid, Left). Average of the three measured WSEs is used as the representative WSE of each channel, as summarized below.

Date	WSE (ft)	
	Left (main)	Right (side)
6/23/2005	96.17	96.42
7/22/2005	95.94	96.20
8/14/2005	95.79	96.02
7/4/2006	95.97	96.27
4/13/2007	95.68	95.95
7/19/2007	95.80	96.08

Left WSE is selected for modeling, because left channel carries more water.
Bed elevations of right channels were adjusted based on the difference between the WSEs of the two channels in order to accommodate the one-WSE requirement in modeling.

Discharge:

All measured discharges are listed in the following table.

Date	Flow (cfs)		
	Left (main)	Right (side)	Total
6/23/2005	117.5	49.8	167.3
7/22/2005			
8/14/2005	66.8	18.1	84.9
7/4/2006	83.1	27.4	110.5
4/13/2007	47.3	13.6	60.9
7/19/2007	54.1	22.0	76.2

No discharge was measured in 7/22/05 site visit.

calibration notes

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (ft/ft)	
	Left (main channel)	Right (side channel)
6/23/2005	1.000%	0.65%
7/22/2005	0.832%	0.58%
8/14/2005	0.982%	0.57%
7/4/2006	0.939%	0.50%
4/13/2007	1.106%	0.55%
7/19/2007	0.900%	0.53%

Date	WSE Slope distance (ft)	
	Left (main channel)	Right (side channel)
6/23/2005	75	80
7/22/2005	51.7	105
8/14/2005	56	103.5
7/4/2006	58.6	81.8
4/13/2007	116.6	153
7/19/2007	134.4	91.6

The slope S=1.000% of 6/23/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Main channel Invert (ft)
6/23/2005	94.67
7/22/2005	
8/14/2005	94.69
7/4/2006	94.77
4/13/2007	94.78
7/19/2007	94.70
Invert	94.78
SZF	94.78

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/22/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/23/2005	167.3	96.17	96.19	0.02	IFG4
2nd	7/22/2005		95.94			
3rd	8/14/2005	84.9	95.79	95.82	0.03	IFG4
4th	7/4/2006	110.5	95.97	95.95	-0.02	IFG4
5th	4/13/2007	60.9	95.68	95.68	0.00	IFG4
6th	7/19/2007	76.2	95.80	95.77	-0.03	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured in 7/22/05 trip
(d) Photos of 4/13/07 showed only residual snow/ice on the ground.
The impact of ice on the hydraulics should be none or minimal.

calibration notes

(3) Velocity calibration

This site has one transect with five velocity/discharge measurements, ranging from 60.9cfs to 167.3cfs.
Each of the five measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow.
No adjustment to n model-calculated n values was needed for any of the five calibrated velocity profiles.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/23/2005	167.3	Y
7/22/2005		
8/14/2005	84.9	Y
7/4/2006	110.5	Y
4/13/2007	60.9	Y
7/19/2007	76.2	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter)
are all within reasonable ranges. Manning's n and Fr, however, are not varying in normal trends and are increasing
and decreasing, respectively, with increasing flows. It is determined this is ok, because the transect has a very
complex bathymetry with islands separating the cross-section into multiple channels. The surveyed hydraulics
showed very different velocities and WSEs in each channel (as much as 0.3ft in WSE difference) such that the
flow did not meet the definition of uniform flow across a transect, a hydraulic condition required when applying
Manning's equation. In addition, the Froude number was originally developed for single-channel transects and
may not be applicable to multiple-channel transects. As the result, the Manning's n value and Fr calculated for
the transect with multiple channels may not realistically reflect the bed roughness of each channel or
adequately indicate the quality of hydraulic calibration for the multiple-channel transect.

Stream: North Fork Koktuli River

Reach: NFK-C

Site/TR: 04-NFK-RN2

Habitat Type: Run

River Kilometer: 22.67

Stream: North Fork Koktuli River
Reach: C
Site Name: 04-NFK-RN2
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	6/23/2005	100.00	101.13	99.94
2nd	7/22/2005	100.00	101.11	99.94
3rd	8/14/2005	100.00	101.12	99.94
4th	7/4/2006	100.00	101.06	99.97
5th	4/12/2007	100.00	100.97	100.02
6th	7/19/2007	100.00	100.96	99.92

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Control pins were stable in 2005 with no more than 0.02ft in relative elevation change
(c) The relative elevation changes of the control pins were irregualr in 2006 and 2007 from 2005, and, as the results, the amount of vertical movements of each control pins may not able to be accurately estimated.
(d) The maximum pin elevation change was 0.10ft or within ±0.05ft. This should be still marginally acceptable given the data were collected over two winters. Therefore, no corrections were applied to the surveyed WSEs.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/23/2005	98.37
7/22/2005	98.11
8/14/2005	97.90
7/4/2006	98.06
4/12/2007	97.64
7/19/2007	97.75

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/23/2005	159.1
7/22/2005	
8/14/2005	71.9
7/4/2006	116.6
4/12/2007	54.5
7/19/2007	70.6

Note: No discharge was measured during the 7/22/05 trip.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/23/2005	0.129%	93
7/22/2005	0.032%	93
8/14/2005	0.032%	93
7/4/2006	0.035%	144
4/12/2007	0.091%	265
7/19/2007	0.049%	164.7

The slope S=0.129% of 6/23/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/23/2005	95.77
7/22/2005	
8/14/2005	95.80
7/4/2006	95.76
4/12/2007	95.84
7/19/2007	95.75
Invert	95.84
SZF	95.84

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/22/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/23/2005	159.1	98.37	98.34	-0.03	IFG4
2nd	7/22/2005		98.11			
3rd	8/14/2005		97.90			
4th	7/4/2006	116.6	98.06	98.10	0.04	IFG4
5th	4/12/2007	54.5	97.64	97.61	-0.03	IFG4
6th	7/19/2007	70.6	97.75	97.77	0.02	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharge was measured during the 7/22/05 site visit.
(d) Flow of 8/14/05 survey is considered an outlier due to its unreasonably high WSE or low discharge, compared to the rest of the surveys.
(e) Photos of 4/12/07 showed channel was clear of ice and only residual ice/snow on banks.

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 54.5cfs to 159.1cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/23/2005	159.1	Y
7/22/2005		
8/14/2005		
7/4/2006	116.6	Y
4/12/2007	54.5	Y
7/19/2007	70.6	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends as flow increases.

(1) Field Data

Level Loop and Headpin Elevations:

Trip	Date	Trip	BM	HP	TP
1st	6/23/2005	1	100.00	95.78	97.37
2nd	7/22/2005	2	100.00	95.76	97.37
3rd	8/14/2005	3	100.00	95.76	97.37
4th	7/4/2006	4	100.00	95.76	97.39
5th	4/12/2007	5	100.00	95.81	97.42
6th	7/19/2007	6	100.00	95.82	97.42

Note : (a) Control pin elevations (BM, HP, TP) are from the first half of each level loop survey
(b) The relative control pin elevation changes were 0.00ft in 2005, 0.02ft in 2006 and 0.06ft in 2007
(c) Control pins only moved insignificantly from 2005 to 2006, and therefore no corrections were needed for the 2006 WSEs.
(d) For 2007 level loops, based on the relative elevation change overtime, it is determined BM had moved lower by 0.03ft - 0.06ft since 2005. As the result, WSEs of 2007 were corrected by subtracting 0.05ft from the measured WSEs.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/23/2005	94.80
8/14/2005	94.42
7/4/2006	94.59
4/12/2007	94.29
7/19/2007	94.42

The WSEs below have reflected the 0.05ft correction made to the 2007 WSEs.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/23/2005	166.1
7/22/2005	
8/14/2005	79.5
7/4/2006	128.9
4/12/2007	55.7
7/19/2007	75.8

No discharge was measured on 7/22/05

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/23/2005	1.015%	22.0
7/22/2005	0.842%	38.0
8/14/2005	0.763%	38.0
7/4/2006	0.842%	130.7
4/12/2007	1.229%	153.0
7/19/2007	1.009%	128.8

The slope S=1.015% of 6/23/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/23/2005	93.00
7/22/2005	
8/14/2005	93.12
7/4/2006	93.19
4/12/2007	93.19
7/19/2007	93.17
Invert	93.19
SZF	93.19

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/22/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR-1	calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/23/2005	166.1	94.80	94.77	-0.03	IFG4
2nd	7/22/2005					
3rd	8/14/2005	79.5	94.42	94.42	0.00	IFG4
4th	7/4/2006	128.9	94.59	94.64	0.05	IFG4
5th	4/12/2007	55.7	94.29	94.28	-0.01	IFG4
6th	7/19/2007	75.8	94.42	94.40	-0.02	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.05ft is within acceptable range.
(c) No discharge was measured during the 7/22/05 site visit.

calibration notes

(3) Velocity calibration

This site has one transect with five velocity/discharge measurements, ranging from 55.7cfs to 166.1cfs.
Each of the five measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment
of n values was made at the stations where simulated velocity was greatly different from the measured
values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/23/2005	166.1	Y
7/22/2005		
8/14/2005	79.5	Y
7/4/2006	128.9	Y
4/12/2007	55.7	Y
7/19/2007	75.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter)
are all within reasonable ranges and appear to vary in normal trends as flow increases.

Stream: North Fork Koktuli River

Reach: NFK-C

Site/TR: 08-NFK2-MS1 (TR-1)

Habitat Type: Run

River Kilometer: 24.65

Stream: NF Koktuli River
Reach: C
Site: 08-NFK2-MS1_TR1
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Date	BM1	BM2	BM3
6/24/2008	100.00	100.30	100.77
7/21/2008	100.00	100.31	100.79
8/16/2008	100.00	100.31	100.78

(a) Elevations of control pins (BM's) are taken from the first half of each level loop survey
(b) Relative elevation changes among the control pins were within ±0.01ft.
(c) The small elevation changes indicated the control pins were stable over the survey period

Measured WSE:

There are two WSEs (Right & Left) measured across each transect for each flow, and the average of the two measured WSEs is used as transect representative WSE for modeling.

Date	WSE (ft)
6/24/2008	98.88
7/21/2008	98.53
8/16/2008	98.16

The WSE across the transect was fairly even with no more than 0.05ft difference

calibration notes

Discharge:

This site has three transects that were at least half a mile apart each between TR-1 and TR-2 and between TR-2 and TR-3. The stream system was very complex in the vicinity of the site. The aerial photo shows tributary/distributary carrying water into and out of the mainstem. In addition, there are possible groundwater discharge/recharge. Also the middle transect, TR-2, has a right channel and a left (main) channel. All the complexities contribute to the flow differences among the transects.

All the measured flows are summarized in the following table.

Date	Measured Q (cfs)			Date	Measured Q				Est'd Q of TR-3 & TR-2
	TR-1	Est'd TR-Q			TR-2			TR-3	
					LC	RC	Total		
6/24/2008	287.4	287.4		6/23/2008	205.5	60.9	266.4	278.0	272.2
7/21/2008	176.9	176.9		7/21/2008	114.8	38.7	153.5	158.7	156.1
8/16/2008	89.2	89.2		8/17/2008	51.2	24.2	75.4	69.7	72.6

Adjusted flows for TR-2

Date	Adjusted Q (cfs)		
	TR-2		
	LC	RC	Total
6/23/2008	210.0	62.2	272.2
7/21/2008	116.7	39.4	156.1
8/17/2008	49.2	23.3	72.6

Longitudinal WSE Slope:

The datums of the three transects of 08-NFK2-MS1 are not connected.
Distances between transects are more than half a mile apart.
No longitudinal WSEs in the vicinity of each transect were surveyed, and thus no slope is calculated.
Default slope value 0.025% was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

	TR-1
6/24/2008	
7/21/2008	95.73
8/16/2008	95.76
Invert	95.76
SZF	96.96

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF of the upstream transect must be no less than that of its downstream transect.
SZF is determined from the WSE calibration process.
(3) SZF must be equal to or greater than the transect invert
(4) Transect profile of TR-1 was not surveyed in the 6/24/08 trip. Only WSEs were surveyed at the transect, and flow was measured at the Q-transect located downstream of TR-1.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Survey Date	Q (cfs)	Measured WSE(ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
		TR-1	TR-1	TR-1	
6/24/2008	287.4	98.88	98.87	0.00	IFG4
7/21/2008	176.9	98.53	98.53	0.00	IFG4
8/16/2008	89.2	98.16	98.15	0.00	IFG4

(a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum calibration error was 0.00ft

calibration notes

(3) Velocity calibration

This site has 3 transects and each one has 2 or 3 velocity/discharge measurements
The transects are about half a mile apart and their elevation datums are not connected.
TR-1 has two measured velocity profiles; Q_{mid} 176.9cfs) and Q_{low} (89.2cfs). High flow was taken at flow transect, located downstream of TR-1, due to safety concern.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow.The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
		TR-2 (Left Ch.)
6/24/2008	287.4	Y
7/21/2008	176.9	Y
8/16/2008	89.2	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are within reasonable ranges and have correct trends.

Stream: North Fork Koktuli River

Reach: NFK-C

Site/TR: 08-NFK2-MS1 (TR2 Left Channel)

Habitat Type: Island Complex

River Kilometer: 26.21

Stream: **NF Koktuli River**
Reach: **C**
Site: **08-NFK2-MS1_TR2_LC**
Habitat Type: **Riffle**

(1) Field Data

Level Loop Surveys:

Date	BM1	BM2	BM3
6/23/2008	100.00	99.69	
7/21/2008	100.00	99.70	99.92
8/17/2008	100.00	99.70	99.92

(a) Elevations of control pins (BM's) are taken from the first half of each level loop survey
(b) Relative elevation changes among the control pins were within 0.01ft.
(c) Elevation control pins were stable for their small relative elevation changes over the survey period

Measured WSE:

There are multiple WSEs (Left, Mid, and Right) measured across each transect for each flow, and the average of the two measured WSEs is used as transect representative WSE for modeling.

Date	WSE (ft)
6/23/2008	97.90
7/21/2008	97.60
8/17/2008	97.41

calibration notes

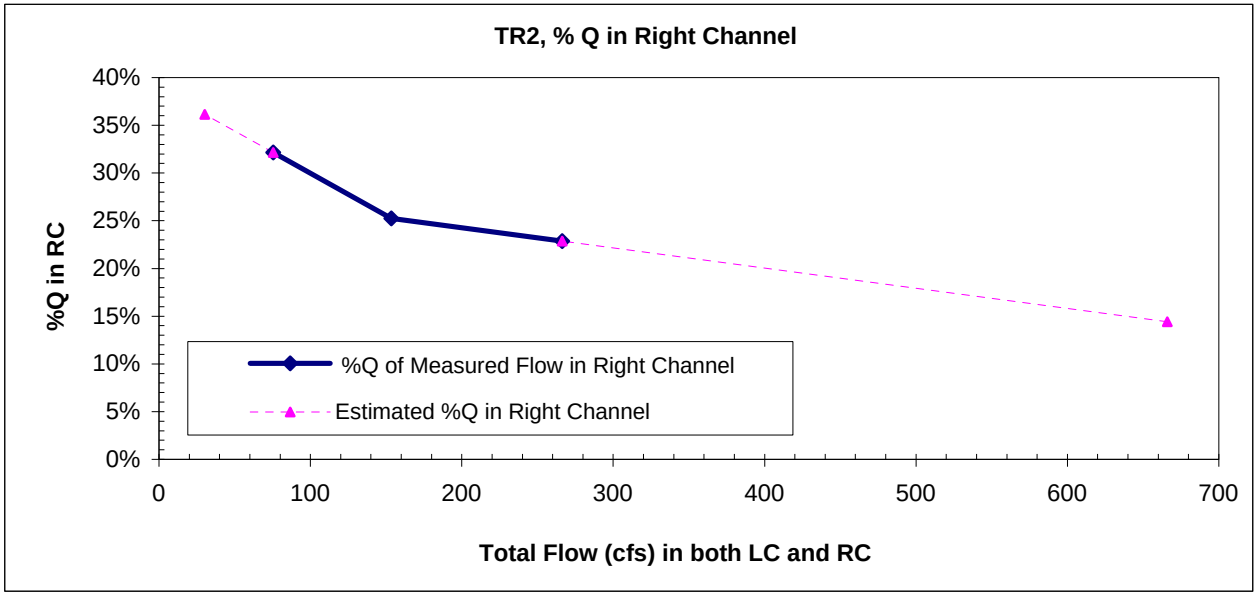
Discharge:

Flow ratio estimate for LC and RC of TR-2

Date	Measured Q in TR-2				
	LC	RC	Total	%Q in RC	
			665.96	14.4%	<--- This is max simulation Q
6/23/2008	205.5	60.9	266.4	22.9%	
7/21/2008	114.8	38.7	153.5	25.2%	
8/17/2008	51.2	24.2	75.4	32.1%	
			30.2	36.1%	<--- This is min simulation Q

Note 1: Estimated %Q in RC is based on the assumption that the relationship between %Q in RC and Total Q remains the same at flows outside the measured flow range.

Note 2: Max simulation flow is 2.5 times of the maximum measured flow.
Min simulation flow is 0.4 time of the minimum measured flow.



calibration notes

Summary for the measured flows of all three transects

Date	Measured Q (cfs)			Date	Measured Q				Est'd Q of TR-3 & TR-2
	TR-1	Est'd TR-Q			TR-2			TR-3	
					LC	RC	Total		
6/24/2008	287.4	287.4		6/23/2008	205.5	60.9	266.4	278.0	272.2
6/24/2008	176.9	176.9		7/21/2008	114.8	38.7	153.5	158.7	156.1
6/24/2008	89.2	89.2		8/17/2008	51.2	24.2	75.4	69.7	72.6

Adjusted flows for TR-2

Date	Adjusted Q (cfs)		
	TR-2		
	LC	RC	Total
6/23/2008	210.0	62.2	272.2
7/21/2008	116.7	39.4	156.1
8/17/2008	49.2	23.3	72.6

Longitudinal WSE Slope:

The datums of the three transects of 08-NFK2-MS1 are not connected.
Distances between transects are more than half a mile apart.
No longitudinal WSEs in the vicinity of each transect were surveyed, and thus no slope is calculated.
Default slope value 0.025% was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Invert
6/23/2008	95.95
7/21/2008	95.95
8/17/2008	96.31
Invert	96.31
SZF	96.76

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF of the upstream transect must be no less than that of its downstream transect.
SZF is determined from the WSE calibration process.
(3) SZF must be equal to or greater than the transect invert

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Survey Date	Q (cfs)	Measured WSE(ft) TR-2 (LC)	Calibrated WSE(ft) TR-2 (LC)	WSE calibration error (ft) TR-2 (LC)	Calib. Method
6/23/2008	210.0	97.90	97.87	-0.03	IFG4
7/21/2008	116.7	97.60	97.64	0.04	IFG4
8/17/2008	49.2	97.41	97.39	-0.02	IFG4

(a) WSE calibration error = calibrated WSE - measured WSE

(b) Maximum calibration error 0.04ft is within the acceptable range

(3) Velocity Calibration:

This site (08-NFK2-MS1) has 3 transects and each transect has 2 or 3 velocity/discharge measurements
The distances between transects are at lease half a mile and the elevation datums of the transects are not connected.
TR-2 has a left channel and a right channel separated by a distance longer than 15 channel widths. The elevation datums of Left and Right channels are not tied together, so the hydraulics of each channel was modeled individually.
TR-2L (left channel) has three measured velocity profiles; high flow, mid flow, and low flow.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N) TR-2 (Left Ch.)
6/23/2008	210.0	Y
7/21/2008	116.7	Y
8/17/2008	49.2	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are within reasonable ranges and have correct trends.

IFG4 Data Deck - TR2 Left Channel

Stream: North Fork Koktuli River

Reach: NFK-C

Site/TR: 08-NFK2-MS1 (TR2 Right Channel)

Habitat Type: Island Complex

River Kilometer: 26.21

Stream: NF Koktuli River
Reach: C
Site: 08-NFK2-MS1_TR2_RC
Habitat Type: Riffle

(1) Field Data

Level Loop and Headpin Elevations:

Date	BM1	BM2	BM3
6/23/2008	99.13	99.29	100.00
7/21/2008	99.13	99.28	99.99
8/17/2008	99.14	99.29	99.99

(a) Elevations of control pins (BM's) are taken from the first half of each level loop survey
(b) Relative elevation changes among the control pins were within 0.01ft.
(c) Elevation control pins were stable for their small relative elevation changes over the survey period

Measured WSE:

There are two WSEs (Left and Right) measured across each transect for each flow, and the average of the two measured WSEs is used as transect representative WSE for modeling.

Date	WSE (ft)
6/23/2008	96.22
7/21/2008	96.08
8/17/2008	95.99

calibration notes

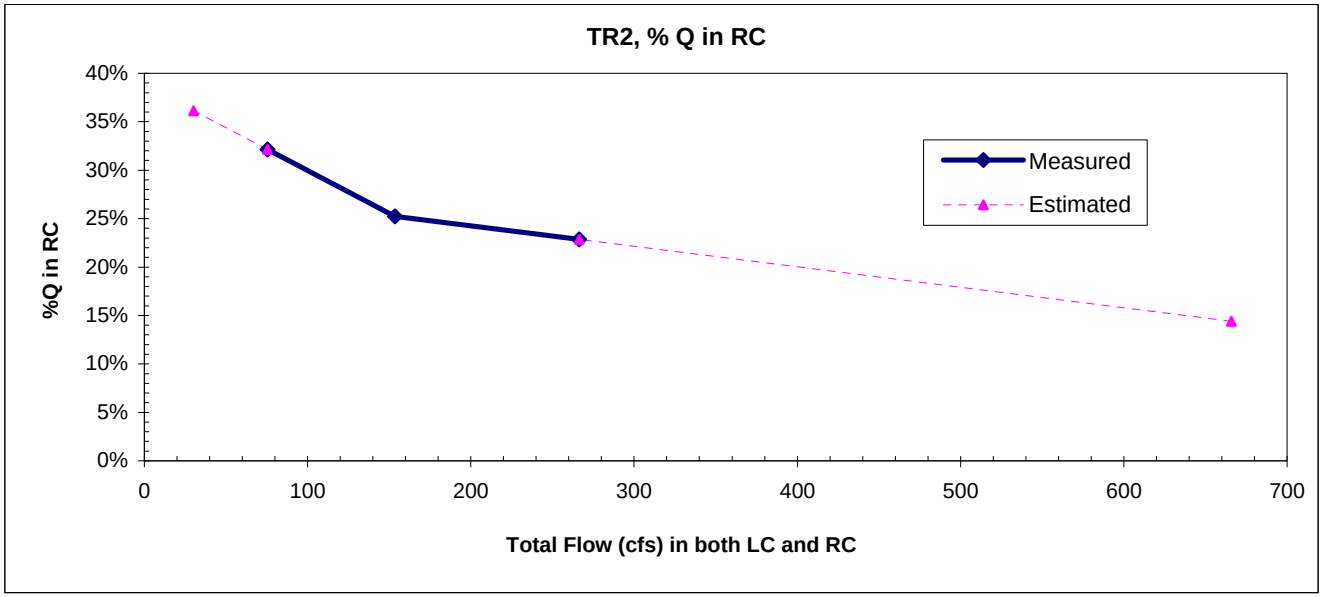
Discharge:

Flow ratio estimate for LC and RC of TR-2

Date	Measured Q in TR-2				
	LC	RC	Total	%Q in RC	
			665.96	14.4%	<--- This is max simulation Q
6/23/2008	205.5	60.9	266.4	22.9%	
7/21/2008	114.8	38.7	153.5	25.2%	
8/17/2008	51.2	24.2	75.4	32.1%	
			30.2	36.1%	<--- This is min simulation Q

Note 1: Estimated %Q in RC is based on the assumption that the relationship between %Q in RC and Total Q remains the same at flows outside the measured flow range.

Note 2: Max simulation flow is 2.5 times of the maximum measured flow.
Min simulation flow is 0.4 time of the minimum measured flow.



calibration notes

Summary for the measured flows of all three transects

Date	Measured Q (cfs)			Date	Measured Q				Est'd Q of TR-3 & TR-2
	TR-1	TR-Q			TR-2			TR-3	
					LC	RC	Total		
6/24/2008	287.4	287.4		6/23/2008	205.5	60.9	266.4	278.0	272.2
7/21/2008	176.9	176.9		7/21/2008	114.8	38.7	153.5	158.7	156.1
8/16/2008	89.2	89.2		8/17/2008	51.2	24.2	75.4	69.7	72.6

Adjusted flows for TR-2

Date	Adjusted Q (cfs)		
	TR-2		
	LC	RC	Total
6/23/2008	210.0	62.2	272.2
7/21/2008	116.7	39.4	156.1
8/17/2008	49.2	23.3	72.6

Longitudinal WSE Slope:

The datums of the three transects of 08-NFK2-MS1 are not connected.
Distances between transects are more than half a mile apart.
No longitudinal WSEs in the vicinity of each transect were surveyed, and thus no slope is calculated.
Default slope value 0.025% was used for hydraulic modeling.

SZF (Stage of Zero Flow):

	Invert
6/23/2008	95.32
7/21/2008	95.23
8/17/2008	95.29
Invert	95.32
SZF	95.82

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF of the upstream transect must be no less than that of its downstream transect.
SZF is determined from the WSE calibration process.
(3) SZF must be equal to or greater than the transect invert

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Survey Date	Q (cfs)	Measured WSE(ft) TR-2 (RC)	Calibrated WSE(ft) TR-2 (RC)	WSE calibration error (ft) TR-2 (RC)	Calib. Method
6/23/2008	62.2	96.22	96.22	0.00	IFG4
7/21/2008	39.4	96.08	96.09	0.01	IFG4
8/17/2008	23.3	95.99	95.99	0.00	IFG4

(a) WSE calibration error = calibrated WSE - measured WSE

(b) Maximum calibration error 0.01ft is within the acceptable range

(3) Velocity calibration

This site (08-NFK2-MS1) has 3 transects and each transect has 2 or 3 velocity/discharge measurements
The distances between transects are at lease half a mile and the elevation datums of the transects are not connected.
TR-2 has a left channel and a right channel separated by a distance longer than 15 channel widths. The elevation datums of Left and Right channels are not tied together, so the hydraulics of each channel was modeled individually.
TR-2R (right channel) has three measured velocity profiles: high flow, mid flow, and low flow.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N) TR-2 (Right Ch.)
6/23/2008	62.2	Y
7/21/2008	39.4	Y
8/17/2008	23.3	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are within reasonable ranges and have correct trends.

6/23/2008	205.5	60.9	266.4	278.0	272.2
7/21/2008	114.8	38.7	153.5	158.7	156.1
8/17/2008	51.2	24.2	75.4	69.7	72.6

calibration notes

Adjusted flows for TR-2

Date	Adjusted Q (cfs)		
	TR-2		
	LC	RC	Total
6/23/2008	210.0	62.2	272.2
7/21/2008	116.7	39.4	156.1
8/17/2008	49.2	23.3	72.6

Longitudinal WSE Slope:

The datums of the three transects of 08-NFK2-MS1 are not connected.
Distances between transects are more than half a mile.
No longitudinal WSEs in the vicinity of each transect were surveyed, and thus no slope is calculated.
Default slope value 0.025% was used for hydraulic modeling.

SZF (Stage of Zero Flow):

	TR-3 Invert
6/23/2008	95.35
7/21/2008	95.34
8/17/2008	95.31
Invert	95.35
SZF	95.35

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF of the upstream transect must be no less than that of its downstream transect.
SZF is determined from the WSE calibration process.
(3) SZF must be equal to or greater than the transect invert

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Survey Date	Q (cfs)	Measured WSE(ft) TR-3	Calibrated WSE(ft) TR-3	WSE calibration error (ft) TR-3	Calib. Method
6/23/2008	272.2	97.95	97.94	0.00	IFG4
7/21/2008	156.1	97.49	97.50	0.01	IFG4
8/17/2008	72.6	97.01	97.01	0.00	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum calibration error 0.01ft is within the acceptable range

(3) Velocity calibration

This site (08-NFK2-MS1) has 3 transects and each transect has 2 or 3 velocity/discharge measurements
The transects are half a mile to a mile apart and their elevation datums are not connected.
TR-3 has three measured velocity profiles; Q_{High} (272.2cfs), Q_{mid} (156.1cfs) and Q_{low} (72.6cfs).
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N) TR-3
6/23/2008	272.2	Y
7/21/2008	156.1	Y
8/17/2008	72.6	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are within reasonable ranges and have correct trends.

Site/TR: 04-NFK-RN3

Habitat Type: Run

River Kilometer: 30.63

Stream: North Fork Koktuli River
Reach: C
Site: 04NFK-RN3
Habitat Type: Run

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP	new TP
1st	6/21/2005	100.00	98.19		
2nd	7/21/2005		98.18	98.54	
3rd	8/14/2005		98.18	98.53	
4th	6/28/2006	100.00	98.18	98.46	
5th	4/12/2007		98.18		
6th	7/19/2007	100.00	98.18		98.77

(a) Elevation of control pins (BM, HP, TP) are taken from the first half of each level loop.
(b) No level loop was conducted during the 4/12/07 site visit when TP was underwater.
HP elevation assumed to have no change.
(c) TP of 7/19/07 survey was a different one. The original one was lost to bank sluffing.
(d) Relative elevation changes between BM and HP were within ±0.01ft from 2005 to 2007.
Small relative elevation change suggested the two pins were stable throughout the survey period.

Measured WSE:

There are three WSEs (Left, Mid, Right) measured across the transect for each flow,
and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/21/2005	96.05
7/21/2005	95.76
8/14/2005	95.42
6/28/2006	95.86
4/12/2007	98.55
7/19/2007	95.37

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/21/2005	106.8
7/21/2005	
8/14/2005	23.5
6/28/2006	70.2
4/12/2007	
7/19/2007	25.8

(1) No discharge was measured on 7/21/05.

(2) Hydraulics of 4/12/07 was affected by ice in the channel. Data not used in modeling.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/21/2005	0.127%	110
7/21/2005	0.091%	110
8/14/2005	0.050%	181.2
6/28/2006	0.075%	147
4/12/2007	NA	NA
7/19/2007	0.042%	167

No longitudinal WSE slope was surveyed on 4/12/07

The slope S=0.127% of 6/21/05 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/21/2005	93.35
7/21/2005	
8/14/2005	93.42
6/28/2006	93.26
4/12/2007	98.05
7/19/2007	93.37
Invert	93.42
SZF	93.42

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/22/05
(4) Invert of 4/12/07 was impacted by ice and was not used in modeling analysis.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR-1	calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/21/2005	106.8	96.05	96.07	0.02	IFG4
2nd	7/21/2005		95.76			
3rd	8/14/2005	23.5	95.42	95.37	-0.05	IFG4
4th	6/28/2006	70.2	95.86	95.85	-0.01	IFG4
5th	4/12/2007		98.55			
6th	7/19/2007	25.8	95.37	95.41	0.04	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.05ft is within acceptable range.
(c) No discharge was measured during the 7/21/05 site visit.
(d) Photos showed the 4/12/07 channel was still covered by ice, and therefore the surveyed hydraulics were not included in the modeling.

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 23.5cfs to 106.8cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment
of n values was made at the stations where simulated velocity was greatly different from the measured
values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/21/2005	106.8	Y
7/21/2005		
8/14/2005	23.5	Y
6/28/2006	70.2	Y
4/12/2007		
7/19/2007	25.8	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter)
are all within reasonable ranges and appear to vary in normal trends as flow increases.

Stream: North Fork Koktuli River

Reach: NFK-C

Site/TR: 04-NFK-IC2

Habitat Type: Island Complex

River Kilometer: 33.65

Stream North Fork Koktuli River
Site: 04-NFK-IC2
Habitat Type: Island Complex

(1) Field Data

Level Loop and Headpin Elevations:

Trip	Date	BM	HP	TP
1st	6/22/2005	100.00	98.30	98.22
2nd	7/22/2005	100.00	98.31	98.23
3rd	8/14/2005	100.00	98.29	98.22
4th	6/28/2006	100.00	98.29	98.17
5th	4/13/2007	100.00	98.41	98.26
6th	7/19/2007	100.00	98.42	98.28

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevation changes of the control pins indicated the pins may have moved as much as 0.1ft from 2005 and 2007.
(c) It is not able to determined which pin(s) had been disturbed from the survey pin elevations. The field notes indicated BM was a nail on the tree trunk, which should be more stable than a rebar driven into the ground for TP/HP that were subject to frost heave in the winter. Therefore, the BM is assumed to be stable during the survey period of 2+ yrs.

calibration notes

Measured WSE:

This transect is an island complex with a main channel, a center channel, and a side channel.
Each channel has three measured WSEs (i.e., Right, Mid, Left). Average of the three measured WSEs is used as the representative WSE of the channel, as summarized below.

Date	WSE (ft)		
	Left (main)	Center	Right (side)
6/22/2005	96.95	96.57	97.30
7/22/2005	96.68	96.37	97.09
8/14/2005	96.46	96.20	96.88
6/28/2006	96.69	96.44	97.02
4/13/2007	99.39	Dry	99.71
7/19/2007	96.38	96.21	96.86

Left WSE is used for modeling, because left channel carries more water.
Bed elevations of the other two channels were adjusted based on the difference in WSEs between the main channel and each of the other two channels in order to meet the one-WSE requirement for modeling.

Discharge:

All measured discharges are listed in the following table.

Date	Flow (cfs)			
	Left (main)	Center	Right (side)	Total
6/22/2005	72.8	4.5	14.7	92.0
7/22/2005	NA			
8/14/2005	37.9	0.0	-0.4	37.5
6/28/2006	63.1	3.5	3.9	70.5
4/13/2007	2.4	NA	0.0	2.4
7/19/2007	31.5	0.1	0.6	32.2

(1) No discharge was measured in the 7/22/05 site visit.
(2) Ice heavily affected the hydraulics of 4/13/07 survey. Data are not used for modeling.

calibration notes

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)		
	Left (main) Channel	Center Channel	Right (side) Channel
6/22/2005	0.660%	0.448%	0.026%
7/22/2005	0.486%	0.478%	-0.026%
8/14/2005	0.378%	NA	-0.012%
6/28/2006	0.471%	NA	0.029%
4/13/2007	NA	NA	NA
7/19/2007	0.457%	NA	0.000%

The slope S=0.660% of 6/22/05 survey was used for hydraulic modeling.

Date	WSE Slope Distance (ft)		
	Left (main) Channel	Center Channel	Right (side) Channel
6/22/2005	57.6	67	76
7/22/2005	57.6	67	76
8/14/2005	140.1	NA	83.1
6/28/2006	104	NA	68.8
4/13/2007	NA	NA	NA
7/19/2007	102.90	NA	81.00

NA indicates either no slope measured or channel dry at the time of measurement.

calibration notes

SZF (Stage of Zero Flow):

Date	Left (Main) Channel Invert (ft)	
6/22/2005	94.45	
7/22/2005		
8/14/2005	94.56	
6/28/2006	94.59	
4/13/2007	97.49	ice impact, data not reliable
7/19/2007	94.63	
Invert	97.49	
SZF	94.63	

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/22/05
(4) Transect of 4/13/07 was under more than 4 feet of ice. Data not reflect the actual bed profile.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR-1	Calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/22/2005	92.0	96.95	96.91	-0.04	IFG4
2nd	7/22/2005					
3rd	8/14/2005	37.5	96.46	96.44	-0.02	IFG4
4th	6/28/2006	70.5	96.69	96.76	0.07	IFG4
5th	4/13/2007					
6th	7/19/2007	32.2	96.38	96.37	-0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration erro 0.07ft is within acceptable range.
(c) No discharge was measured in 7/22/05 site visit.
(d) Hydraulics of 4/13/07 survey was severely affected by ice. Surveyed data not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 32.2cfs to 92.0cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment
of n values was made at the stations where simulated velocity was greatly different from the measured
values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/22/2005	92.0	Y
7/22/2005		
8/14/2005	37.5	Y
6/28/2006	70.5	Y
4/13/2007		
7/19/2007	32.2	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter)
are all within reasonable ranges and appear to vary in normal trends as flow increases.

Reach: **Trib 190**
Site: **08-NFK-190**

(1) Field Data

Level Loop Surveys:

Date	BM1	BM2	BM3
6/23/2008	100.00	99.40	100.26
7/26/2008	99.96	99.39	100.25
8/21/2008	99.96	99.40	100.25

(a) Elevations of control pins (BM's) are taken from the first half of each level loop survey
(b) Relative elevation changes between BM2 and BM3 were within ±0.01ft
(c) The small elevation changes indicated control pins were stable over the survey period

Measured WSE:

There are multiple WSEs measured across each transect for each flow, and the average of the measured WSEs is used as transect representative WSE for modeling.

	Measured WSE (ft)		
Date	TR-1	TR-2	TR-3
6/23/2008	97.21	97.36	97.56
7/26/2008	96.75	96.83	97.07
8/21/2008	96.38	96.43	96.60

Discharge:

All measured discharges are listed in the following table.

	Measured WSE (ft)			Ave
Date	TR-1	TR-2	TR-3	Q (cfs)
6/23/2008		76.2	71.6	73.9
7/26/2008	33.3	31.6	29.9	31.6
8/21/2008	11.8	12.0	13.9	12.6

No flow measured at TR-1 during the 6/23/08 site visit.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the measured WSEs and estimated distances.
The distances were determined from the GPS points and transect locations using GIS tools.
No distances were surveyed using a tape measure.

TR	River Station (ft)		
	TR-1	TR-2	TR-3
LB	0.00		
RB	0.00		
Ave	0.00	52.4	97.6
Station	0.00	52.4	97.6

Date	Slope (%) from TR-1		
	TR-1	TR-2	TR-3
6/23/2008	-	0.286%	0.364%
7/26/2008	-	0.143%	0.323%
8/21/2008	-	0.086%	0.220%
GPS	-	-	-

The distance of 52.4ft between TR-1 and TR-2 was determined by GIS tools on 12/9/2009
The distance of 45.2ft between TR-2 and TR-3 was determined by GIS tools on 12/9/2009
Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.
The TR-3 slope S=0.364% of 6/23/2008 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Discharge (cfs)		
	TR-1	TR-2	TR-3
6/23/2008		94.96	95.66
7/26/2008	94.25	95.03	95.67
8/21/2008	94.23	94.93	95.60
Invert	94.25	95.03	95.67
SZF	94.25	95.03	95.67

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
SZF of the upstream transect must be no less than that of its downstream transect.

calibration notes

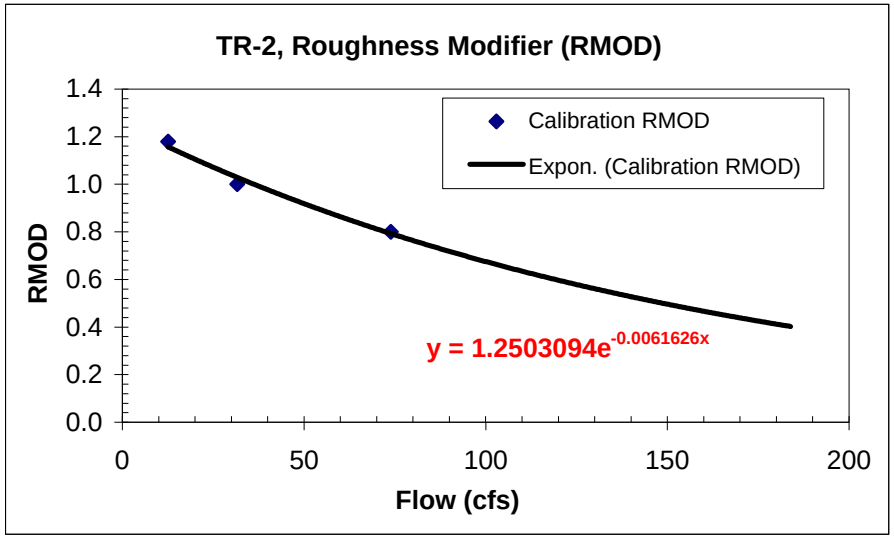
(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

TR-1 and TR-2 were calibrated using IFG4 and TR-3 was calibrated using WSP

WSP WSE calibration summary for TR-3:

Measured Flow (cfs)	Calibration RMOD
12.6	1.18
31.6	1.00
73.9	0.80



calibration notes

WSE Calibration Results:

Calibration results are summarized in the following table.

Survey Date	Q (cfs)	Measured WSE(ft)			Calibrated WSE(ft)		
		TR-1	TR-2	TR-3	TR-1	TR-2	TR-3
6/23/2008	73.9	97.21	97.36	97.56	97.21	97.36	97.55
7/26/2008	31.6	96.75	96.83	97.07	96.74	96.82	97.03
8/21/2008	12.6	96.38	96.43	96.60	96.38	96.43	96.65

Survey Date	Q (cfs)	WSE calibration error (ft)			WSE Calib. Method		
		TR-1	TR-2	TR-3	TR-1	TR-2	TR-3
6/23/2008	73.9	0.00	0.00	-0.01	IFG4	IFG4	WSP
7/26/2008	31.6	-0.01	-0.01	-0.03	IFG4	IFG4	WSP
8/21/2008	12.6	0.00	0.01	0.05	IFG4	IFG4	WSP

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum calibration error 0.05ft is within the acceptable range

(3) Velocity calibration

This site has three transects and each transect has 2 or 3 velocity/discharge measurements
TR-1 has two measured velocity profiles and TR-2 and TR-3 each has 3 measured profiles.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)		
		TR-1	TR-2	TR-3
6/23/2008	73.9		Y	Y
7/26/2008	31.6	Y	Y	Y
8/21/2008	12.6	Y	Y	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges with correct trends except the Manning's n and Fr of TR-3. Photos show steep local bed slope just above TR-3 that creates faster flow condition at the transect as the flow is low. As the result, the Manning's n value would be relatively small (for the same assumed slope) and Fr relatively large. The local steep slope is drowned out as flows grow larger (e.g., Q>50cfs) when the Fr and Manning's n would return to the normal trend, as shown in the hydraulic model parameter figures for TR-3.

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	AP	TP
1st	6/15/2005	100.00	99.50	98.37	99.23
2nd	7/18/2005	100.00	99.52	98.38	99.26
3rd	8/12/2005	100.00	99.51	98.39	99.25
4th	7/9/2006	100.00	99.52	97.98	99.26
5th	4/11/2007	100.00	99.53		99.29

(a) Elevations of control pins (BM, HP, AP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between control pins were within ±0.02ft during 2005-2006 period. Small changes of elevations indicated control pins were stable during that period.
(c) AP, Angle Pin, is a working pin located in the channel between TP and HP. The elevation changes indicated it may have been disturbed due to channel aggradation/degradation over the 2006-2007 winter. This won't affect the accuracy of survey because the datum was based on BM.

calibration notes

Measured WSE:

This transect has a complex bathymetry with two islands separating the cross-section into Left channel, Main-L channel, and Main-R channel. Each channel has multiple surveyed WSEs, including LWSE, MWSE and RWSE, taken during each site visit. Each of the WSE shown below is the average of the multiple WSEs of each channel.

Date	WSE (ft)		
	Left	Main-L	Main-R
6/15/2005	96.63	96.95	97.01
7/18/2005	96.36	96.75	96.55
8/12/2005	95.99	dry	96.28
7/9/2006	96.19	96.88	96.78
4/11/2007	95.95	dry	96.36

WSEs of Main-R channel were used for modeling, because Main-R channel carried the majority of water. The bed profile of the rest part of the transect was adjusted based on their WSE differences from the Main-R channel.

Discharge:

All measured discharges are listed in the following table, including all three channels.

Date	Flow (cfs)			
	Left (side)	Left (main)	Right (main)	Total
6/15/2005	33.1	24.3	179.3	236.7
7/18/2005	NA	NA	NA	NA
8/12/2005	1.8	dry	65.2	67.0
7/9/2006	3.8	8.9	150.04	162.8
4/11/2007	0.4		96.4	96.8

No flows was measured during the 7/18/05 site visit.
Partial flow was measured during the 4/11/07 site visit. Most of the transect was covered in ice.

calibration notes

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (ft/ft)		
	Left (side)	Main-Left	Main-Right
6/15/2005	0.346%	NA	0.497%
7/18/2005	0.452%	NA	0.528%
8/12/2005	0.000%	NA	0.182%
7/9/2006	0.374%	NA	0.560%
4/11/2007	0.043%	NA	0.353%

The slope S=0.497% of 6/15//2005 survey was used for hydraulic modeling.

Date	WSE Slope Distance (ft)		
	Left (side)	Main-Left	Main-Right
6/15/2005	115.6	NA	174.3
7/18/2005	101.7	NA	132.5
8/12/2005	21.4	NA	82.3
7/9/2006	98.8	NA	169.5
4/11/2007	70.30	NA	90.60

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/15/2005	94.41
7/18/2005	
8/12/2005	94.38
7/9/2006	94.18
4/11/2007	94.26
Invert	94.41
SZF	94.41

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Substrate was collected on 7/18/05, but no bed profile was surveyed on that date.
(4) Photos of 4/11/07 site visit showed most of the transect was still covered in ice, and thus the surveyed hydraulics of this date were not used for modeling.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/15/2005	236.7	97.01	97.02	0.01	IFG4
2nd	7/18/2005	NA	96.55			
3rd	8/12/2005	67.0	96.28	96.28	0.00	IFG4
4th	7/9/2006	162.8	96.78	96.77	-0.01	IFG4
5th	4/11/2007	96.8	96.36			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) No discharge was measured during the 7/18/05 trip, and only partial flow was measured in 4/11/07 trip.
(d) Photos of 4/11/07 trip showed most of the transect was covered in ice. Hydraulics were apparently impacted by the ice and were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 67.0cfs to 236.7cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow.
No adjustments for the model-calculated n values were needed for any of the three calibrated velocity profiles.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/15/2005	236.7	Y
7/18/2005	NA	
8/12/2005	67.0	Y
7/9/2006	162.8	
4/11/2007	96.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are
all within reasonable ranges and appear to vary in normal trends.

IFG4 Data Deck

Stream: South Fork Koktuli River

Reach: SFK-A

Site/TR: 05-SFK1-RF1

Habitat Type: Riffle

River Kilometer: 4.91

Stream: South Fork Koktuli River
Reach: A
Site: 05-SFK1-RF1
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/15/2005	1	100.00	99.95	103.32
2nd	7/18/2005	2	100.00	99.96	103.33
3rd	8/11/2005	3	100.00	99.95	103.32
4th	7/9/2006	4	100.00	99.96	103.32
5th	4/11/2007	5	100.00	99.96	103.33

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between control pins were within 0.01ft during 2005-2007 period.
(c) Small changes of elevations indicated control pins were stable.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/15/2005	98.11
7/18/2005	97.84
8/11/2005	97.59
7/9/2006	97.92
4/11/2007	97.89

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/15/2005	224.2
7/18/2005	
8/11/2005	70.5
7/9/2006	147.9
4/11/2007	82.8

No flow was surveyed during the 7/18/05 site visit.
Photos of 4/11/07 site visit showed ice/snow on banks and waters edge. Hydraulics were impacted by ice and thus were not used for modeling.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/15/2005	0.367%	201.8
7/18/2005	0.417%	192.0
8/11/2005	0.350%	171.2
7/9/2006	0.491%	171.0
4/11/2007	0.311%	132.0

The slope S=0.337% of 6/15/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/15/2005	96.41
7/18/2005	
8/11/2005	95.89
7/9/2006	96.52
4/11/2007	96.59
Invert	96.52
SZF	95.89

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Substrate was collected on 7/18/05, but no bed profile was surveyed on that date.
(4) Photos of 4/11/07 site visit showed ice on both sides of the channel, which may have resulted in an inconsistent WSE-Q relationship on rating curve.
The inconsistent relationship suggested the hydraulics were impacted by the ice. As the result, hydraulics, including channel invert, of this date were not used for further analysis.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/15/2005	224.2	98.11	98.12	0.01	IFG4
2nd	7/18/2005	NA	97.84			
3rd	8/11/2005	70.5	97.59	97.59	0.00	IFG4
4th	7/9/2006	147.9	97.92	97.91	-0.01	IFG4
5th	4/11/2007	82.8	97.89			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) No discharge was measured during the 7/18/05 trip, and only partial flow was measured in 4/11/07 trip.
(d) Photos of 4/11/07 trip showed most of the transect was covered in ice. Hydraulics were apparently impacted by the ice and thus were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, ranging from 70.5cfs to 224.2cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For any of the three calibrated velocity profiles, no adjustments were needed for the model-calculated n values.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/15/2005	224.2	Y
7/18/2005	NA	
8/11/2005	70.5	Y
7/9/2006	147.9	
4/11/2007	82.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends.

(1) Field Data

Level Loop Surveys:

Date	BM1	BM2	BM3	4-CWP
6/22/2008	100.00	99.95		99.56
7/22/2008	100.00	99.95		
8/15/2008	100.00	99.95	100.49	99.55

(a) Elevations of control pins (BM's, CWP) are taken from the first half of each level loop survey
(b) Relative elevation change between the control pins were within 0.01ft.
(c) Samll elevation changes indicated the control pins were stable during the entire course of survey period.

Measured WSE:

TR-1, TR-5, and TR-6 have a single channel, and TR-2, TR-3, and TR-4 have multiple channels (LC and RC).
WSEs were measured on the left (LWSE) and right (RWSE) sides of each channel.
Average of the left and right WSEs is used as transect representative WSE for modeling.

Date	Measured WSE (ft)								
	TR-1	TR-2		TR-3		TR-4		TR-5	TR-6
		LC	RC	LC	RC	LC	RC		
6/22/2008	97.85	98.28	98.02	98.97	98.51	99.26	99.24	99.36	100.07
7/22/2008	97.19	97.56	97.28	98.29	97.84	98.61		98.77	99.17
8/15/2008	96.38	96.89	96.94	97.63		98.03		98.11	98.39

WSEs of RC and LC are not the same, but the WSEs of left channels are used for hydraulic calibration, because most of the water flows through the left channels. The bed bathymetry of RCs is adjusted, with the amount of the WSE difference between RC and LC, so that both channels (RC and LC) would have the same WSE, as required by the IFG4 model.

calibration notes

Discharge:

All measured discharges are listed in the following table.

The discharge include the flows of both RC and LC for the multiple channel transects (i.e., TR-2, TR-3, TR4).

Date	Measured Discharge (cfs)						**Ave Q (cfs)**
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	
6/22/2008					436.0		**436.0**
7/22/2008	234.4	252.2	257.4	249.0	241.4	251.9	**247.7**
8/15/2008	98.8	98.8	99.1	100.1	109.4	94.7	**100.1**

Average Q is used as the representative flows of the site for hydraulic calibration

Longitudinal WSE Slope:

Slopes are calculated from the measured WSEs and longitudinal distances

	Longitudinal Stations					
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
LB	0.0	131.0	248.0	43.0	56.0	250.0
RB	0.0	156.0	192.0	59.0	24.0	300.0
Ave	0.0	143.5	220.0	51.0	40.0	275.0
Station	0.0	143.5	363.5	414.5	454.5	729.5

	Slope					
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/22/2008	-	0.303%	0.309%	0.341%	0.332%	0.304%
7/22/2008	-	0.254%	0.303%	0.343%	0.347%	0.271%
8/15/2008	-	0.355%	0.343%	0.397%	0.381%	0.276%

Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.

The TR-6 slope S=0.304% of 6/22/2008 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/22/2008					96.76	
7/22/2008	94.29	95.06	96.09	96.41	96.77	96.57
8/15/2008	94.23	95.09	96.13	96.43	96.76	96.59
Invert	94.29	95.09	96.13	96.43	96.77	96.59
SZF	94.29	95.09	96.13	96.43	96.77	96.77

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) SZF of the upstream transect must be no less than that of its downstream transect.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

TR-1 through TR-5 were calibrated using IFG4.
WSEs of TR-6 were calibrated using both IFG4 and MANSQ models, and a composite WSE~Q relationship was developed using the WSE~Q rating curves derived from each of the two models. The details of developing the composite curve are shown below.

Simulation	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6		
	Simulated WSE							Composite
Q (cfs)	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4	MANSQ	WSE

1100	99.26	99.69	100.33	100.52	100.66	101.83	101.07	101.07

(1) β=-0.25 was used for MANSQ modeling

(2) Comparison of measured and calibrated WSEs are plotted in the WSE comparison figure.
The "bump" at Qhigh on TR-6 curve may be due to the sharp bend just below TR-6.
The bend could cause the water to back up when flow velocity is high.

WSE Calibration Results:

Survey Date	Q (cfs)	Measured WSE(ft)						Calibrated WSE(ft)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/22/2008	436.0	97.85	98.28	98.97	99.26	99.36	100.07	97.85	98.24	98.94	99.22	99.35	100.07

(a) WSE calibration error = calibrated WSE - measured WSE

(b) All calibration errors are no more than 0.05ft, except the mid flow of TR-6.

calibration notes

(3) Velocity calibration

This site has six transects and each transect has 2 or 3 velocity/discharge measurements.
TR-5 has three measured velocity profiles while the other five transects each has only 2 measured profiles.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

The Q_{high} velocity profile of TR-3 was only measured in the right channel during the 6/22/08 site visit. Instead of tossing out the partial measurement, the Q_{high} velocity distribution (i.e., profile) in the left channel was estimated using the measured Q_{mid} velocity distrubution surveyed on 7/22/08. Then the simulated (i.e., estimated) velocity profile of Q_{high} is combined with the partial measured velocity profile to become a complete velocity profile for Q_{high}.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/22/2008	436.0					Y	
7/22/2008	247.7	Y	Y	Y	Y	Y	Y
8/15/2008	100.1	Y	Y	Y	Y	Y	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges. TR-1, TR-5, and TR-6 are single channels, and their hydraulic parameters all have the normal trends in the direction of increasing flow. TR-2, TR-3, and TR-4 each has multiple channels with an island separating the transect into two channels, and consequently the trends of their hydraulic parameters are difficult to predict. The definition of Fr is for the transect with a single channel may not be applicable to the transect with multiple channels for accurate calculation.

MANSQ Data Deck

Stream: South Fork Koktuli River

Reach: SFK-A

Site/TR: 04-SFK-IC1

Habitat Type: Island Complex

River Kilometer: 12.36

Stream: South Fork Koktuli River
Reach: A
Site: 04-SFK-IC1
Habitat Type: Island Complex

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP
1st	6/24/2005	100.00	99.43	99.37
2nd	7/18/2005	100.00	99.40	99.41
3rd	8/12/2005	100.00	99.37	99.35
4th	7/3/2006	100.00	99.64	99.52
5th	7/9/2006	100.00	99.55	99.51
6th	4/13/2007			

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) No level loop was conducted during the 4/13/07 site visit
(c) Level loop results showed pins were disturbed, but unable to accurately determine the amount of disturbance to the elevation datum from the survey results.

Measured WSE:

This transect has three channels (Left, Center, Right) with each one having one to three measured WSEs. Average of the measured WSEs in each individual channel was use as the representative WSE of that channel, as listed below, for hydraulic modeling:

	WSE (ft)		
Date	Left (main)	Center	Right (side)
6/24/2005	97.28	96.95	96.80
7/18/2005	97.02	96.88	96.78
8/12/2005	96.63	dry	96.62
7/3/2006	97.20	96.99	96.86
7/9/2006	97.14	96.93	96.78
4/13/2007	?	ice	ice

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Flow (cfs)			
	Left (main)	Center	Right (side)	Total
6/24/2005	177	0	2	178.3
7/18/2005	NA	NA	NA	
8/12/2005	59	Dry	0	58.3
7/3/2006	NA	NA	NA	
7/9/2006	145	0	0	145.1
4/13/2007	57	NA	NA	

No discharges were surveyed in the 7/18/05 and 7/3/06 site visits.
Flow measurement was incomplete for the 4/13/07 site visit.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Left (Main) Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/24/2005	0.243%	103
7/18/2005	0.163%	184.2
8/12/2005	0.413%	104
7/3/2006	0.161%	117.9
7/9/2006	0.165%	109
4/13/2007	0.264%	277

The slope S=0.243% of 6/24/2005 survey was used for hydraulic modeling.

Center Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/24/2005	0.050%	20
7/18/2005		
8/12/2005		
7/3/2006		
7/9/2006		
4/13/2007	NA	NA

Right (Side) Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/24/2005	0.000%	35.3
7/18/2005	0.016%	62.8
8/12/2005	-0.057%	87
7/3/2006	0.015%	68.8
7/9/2006	0.054%	56
4/13/2007	NA	NA

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/24/2005	95.40
7/18/2005	NA
8/12/2005	95.42
7/3/2006	95.31
7/9/2006	95.38
4/13/2007	NA
Invert	95.42
SZF	95.42

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Transect profile of 7/18/05 was not measured. Transect profile of 4/13/07 was incomplete
(4) Invert of 4/13/07 was impacted by ice and not used in modeling analysis.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR-1	Calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/24/2005	178.3	97.28	97.28	0.00	IFG4
2nd	7/18/2005		97.02			
3rd	8/12/2005	58.3	96.63	96.63	0.00	IFG4
4th	7/3/2006		97.20			
5th	7/9/2006	145.1	97.14	97.14	0.00	IFG4
6th	4/13/2007		?			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No or only partial discharges were measured during the 7/18/05, 7/3/06, and 4/13/07site visits.
(d) Photos of 4/13/07 showed ice on banks and waters edge. Data of this date not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 58.3cfs to 178.3cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/24/2005	178.3	Y
7/18/2005		
8/12/2005	58.3	Y
7/3/2006		
7/9/2006	145.1	Y
4/13/2007		

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends with increasing flows as flows > Q_{mid}=145.1cfs.
The hydraulic parameters vary in opposite trends as Q<Q_{mid}. This may be caused by (1) the complex multiple-channel bathymetry to which the Froude number definition (Fr=V_ave/sqrt(g*A/T), Chow, 1959) may not be applicable and (2) the very different WSE levels and velocity distributions across the multiple channels in the transect, where the definition of uniform flow, as required by the Manning's equation, may not be completely satisfied. As the result, the calculated Manning's n values for characterizing the channel roughness may not reflect the actual flow resistance of each individual channel.

Stream: **SF Koktuli River**
Reach: **A**
Site: **08-SFK1-MS2**

(1) Field Data

Level Loop Surveys:

Date	BM1	BM2	BM3	BM4	BM5
6/21/2008	100.00	100.04	96.65	96.74	
7/24/2008	100.00	100.06	96.73	96.84	
8/7/2008	100.00	100.04	96.69	96.80	
8/17/2008	100.00	100.04	96.73		97.00

(a) Pin elevations are taken from the first half of each level loop survey
(b) Field crew indicated BM4 was not stable, so its elevation was not used for determining control pin stability.
(c) Relative elevation changes between BM1 and BM2 were within 0.02ft.
(d) BM 1 and BM2 were rebars driven into the ground and field crew indicated both appeared stable, and therefore they are used as elevation control pins for all level loop surveys.

Measured WSE:

There were multiple WSEs surveyed across each channel/transect for each flow, and the average of the measured WSEs of each channel/transect was summarized in the following table.

Date	WSE (ft)								
	TR-1	TR-2	TR-3		TR-4		TR-5		TR-6
			LC	RC	LC	RC	LC	RC	
6/21/2008	93.27	93.78	94.40	94.53	94.45	94.71	95.44	95.45	95.96
7/24/2008	93.01	93.39	94.07	94.15	94.06	94.28	95.22	95.18	95.65
8/7/2008	92.64	92.93	93.44	93.50	93.44	93.54	94.88	94.69	95.15
8/17/2008	92.52	92.89	93.37	93.42	93.38	93.48	94.65	94.53	94.96

WSEs of RC and LC are not the same for the Island Complex transects (i.e., TR-3, TR-4, TR-5), but the WSEs of right channels are used for hydraulic calibration, because most of the water flows through the right channels. The bed bathymetry of LCs is adjusted, with the amount of the WSE difference between RC and LC, so that both channels (RC and LC) would have the same WSE, as required by the IFG4 model.

calibration notes

Discharge:

All measured discharges are listed in the following table.

The discharge include the flows of both RC and LC for the multiple channel transects (i.e., TR-3, TR-4, TR-5).

	Discharge (cfs)						
Date	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	Ave Q
6/21/2008				395.5		392.1	393.8
7/24/2008	261.4	237.0	261.8	235.5	272.5	246.6	252.5
8/7/2008		104.8		93.8			99.3
8/17/2008	77.6		81.1		81.4	70.7	77.7

Average Q of all measured flows is used as the representative flows of the site for hydraulic calibration

Longitudinal WSE Slope:

Slopes are calculated using the measured WSEs and longitudinal distances.

Distances are calculated in Dec, 2009 based on the channel centerline on which transects are located.

	Longitudinal Stations					
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
LB RB						
Ave						
Station	0.0	263.2	683.8	854.6	1129.5	1281.2

	Slope					
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/21/2008	-	0.194%	0.184%	0.168%	0.193%	0.210%
7/24/2008	-	0.144%	0.166%	0.149%	0.192%	0.206%
8/7/2008	-	0.110%	0.126%	0.105%	0.182%	0.196%
8/17/2008	-	0.142%	0.132%	0.113%	0.178%	0.191%

Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.

The TR-6 slope S=0.210% of 6/21/2008 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Discharge (cfs)					
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/21/2008				91.16		93.21
7/24/2008	91.61	91.49	90.60	91.18	93.28	93.20
8/7/2008		91.58		90.89		
8/17/2008	91.62		90.72		93.38	93.26
Invert	91.62	91.58	90.72	91.18	93.38	93.26
SZF	91.62	91.68	91.68	91.68	93.38	93.38

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) SZF of upstream transect must be no less than that of the downstream transect.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

IFG4 was applied to calibrating the WSEs of all 6 transects.

WSE Calibration Results:

Survey Date	Q (cfs)	Measured WSE(ft)						Calibrated WSE(ft)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6

Survey Date	Q (cfs)	WSE calibration error (ft)						WSE Calibration Method					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/21/2008	393.8	-0.01	-0.04	-0.01	-0.01	0.02	0.01	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4
7/24/2008	252.5	0.01	0.05	0.00	0.00	-0.02	0.00	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4
8/7/2008	99.3	0.00	0.02	0.03	0.04	-0.03	-0.04	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4
8/17/2008	77.7	0.03	-0.04	-0.03	-0.05	0.02	0.03	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) All calibration errors are no more than 0.05ft

calibration notes

(3) Velocity calibration

This site has six transects and each transect has 2 or 3 velocity/discharge measurements.
TR-4 and TR-6 each has three measured velocity profiles and the other four transects (TR-1, TR-2, TR-3, TR-5) each has 2 measured profiles. Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocities were greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures in that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges with normal trends. The Manning's n values and Froude numbers of TR-5, however, are slightly out of the normal trends between 70cfs and 300cfs because of increasing n value and decreasing Fr as flows increase. This is ok because Q=70cfs~300cfs is approximately in the same range as the measured flows (77 cfs to 393 cfs), and the trends are just reflecting the hydraulic behavior within that flow range. Also the maximum WSE calibration is 0.05ft or less, and the irregularity between 70cfa and 300cfs should not be the result of calibration errors.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/21/2008	393.8						Y
7/24/2008	252.5	Y	Y	Y	Y	Y	Y
8/7/2008	99.3	Y			Y		Y
8/17/2008	77.7		Y	Y	Y	Y

Stream: South Fork Koktuli River

Reach: SFK-A

Site/TR: 04-SFK-RF3

Habitat Type: Riffle

River Kilometer: 19.80

Stream: South Fork Koktuli River
Reach: A
Site: 04-SFK-RF3
Habitat Type: Riffle

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP
1st	6/24/2005	100.00	99.79	100.53
2nd	7/17/2005	100.00	99.78	100.52
3rd	8/11/2005	100.00	99.77	100.52
4th	7/6/2006	100.00	99.75	100.49

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes of the control pins were within 0.04ft.
(c) Small changes of elevations indicated the pins were stable during the 2005-2006 period.

Measured WSE:

Multiple WSEs were surveyed across the transect, but due to the complexity of hydraulics, the WSEs had as much as 0.52ft in difference within the transect of the same flow. To best model the hydraulics, the Right WSE was used for the modeling. Bed profile of the rest part of the channel of each flow was adjusted based on the WSE difference from the right WSE.

	WSE		
Date	Left	Center	Right
6/24/2005	97.82	98.08	98.18
7/17/2005	97.73	97.96	98.00
8/11/2005	97.26	97.69	97.78
7/6/2006	97.58	97.92	98.01

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Q (cfs)			
	Left	Center	Right	Total
6/24/2005	45.0	10.3	94.5	149.8
7/17/2005				
8/11/2005	3.9	0.61	43.6	48.1
7/6/2006	18.1	3.3	85.3	106.8

No discharge was surveyed in 7/17/05 survey

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/24/2005	0.763%	114
7/17/2005	0.588%	221
8/11/2005	0.561%	221
7/6/2006	0.698%	147.6

The slope S=0.763% of 6/24/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/24/2005	95.52
7/17/2005	
8/11/2005	95.76
7/6/2006	95.58
Invert	95.76
SZF	95.76

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was measured in 7/17/05 trip

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/24/2005	149.8	98.18	98.16	-0.02	IFG4
2nd	7/17/2005		98.00			
3rd	8/11/2005	48.1	97.78	97.77	-0.01	IFG4
4th	7/6/2006	106.8	98.01	98.04	0.03	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured on 7/17/05.

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 48.1cfs to 149.8cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow.
No adjustment to the model-calculated n values was made for any of the three calibrated velocity profiles.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/24/2005	149.8	Y
7/17/2005		
8/11/2005	48.1	Y
7/6/2006	106.8	

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends.

IFG4 Data Deck

Stream: South Fork Koktuli River

Reach: SFK-A

Site/TR: 04-SFK-RN3

Habitat Type: Run

River Kilometer: 20.10

Stream: South Fork Koktuli River
Reach: A
Site: 04-SFK-RN3
Habitat Type: Run

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP
1st	6/24/2005	100.00	97.97	98.37
2nd	7/17/2005	100.00	97.97	98.36
3rd	8/11/2005	100.00	97.98	98.35
4th	7/3/2006	100.00	98.00	98.47
5th	7/6/2006	100.00	98.01	98.47

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM and HP were within 0.04ft.
(c) Small changes of elevations indicated BM & HP were stable during the 2005-2006 period.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/24/2005	96.17
7/17/2005	96.00
8/11/2005	95.58
7/3/2006	96.07
7/6/2006	95.97

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/24/2005	142.8
7/17/2005	
8/11/2005	53.4
7/3/2006	
7/6/2006	98.8

No Flows were measured during the 7/17/05 and 7/3/06 trips

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/24/2005	0.284%	88
7/17/2005	0.212%	118
8/11/2005	0.192%	104
7/3/2006	0.284%	149
7/6/2006	0.228%	116.2

The slope S=0.284% of 6/24//2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/24/2005	94.37
7/17/2005	
8/11/2005	94.38
7/3/2006	94.39
7/6/2006	94.37
Invert	94.39
SZF	94.39

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Bed profile was surveyed on 7/3/06, but no discharge was measured on that date.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/24/2005	142.8	96.17	96.20	0.03	IFG4
2nd	7/17/2005		96.00			
3rd	8/11/2005	53.4	95.58	95.59	0.01	IFG4
4th	7/3/2006		96.07			
5th	7/6/2006	98.8	95.97	95.95	-0.02	

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharges were measured during the 7/17/05 and 7/3/06 trips.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 53.4cfs to 142.8cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/24/2005	142.8	Y
7/17/2005		
8/11/2005	53.4	Y
7/3/2006		
7/6/2006	98.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends.

Stream: South Fork Koktuli River

Reach: SFK-A

Site/TR: 07-SFK1-RF1

Habitat Type: Riffle

River Kilometer: 24.21

Stream: South Fork Koktuli River
Reach: A
Site: 07-SFK1-RF1
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/13/2007	1	100.00	99.19	99.22
2nd	7/18/2007	2	100.00	99.13	99.22
3rd	9/20/2007	3			
4th	10/19/2007	4	100.00	99.09	99.23

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM and TP were within 0.01ft.
(c) Small changes of elevations suggested BM and TP were stable.
(d) No level loop survey was conducted during the 9/20/07 site visit
(e) The relative elevations showed HP continued to sink from June to October for 0.1ft.
No corrections to WSE's were needed because the suevey datum were based on BM.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/13/2007	96.78
7/18/2007	96.60
9/20/2007	98.23
10/19/2007	97.24

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/13/2007	107.4
7/18/2007	63.3
9/20/2007	
10/19/2007	220.0

No discharge was measured during the 9/20/07 site visit

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/13/2007	0.787%	75
7/18/2007	0.921%	89
9/20/2007	0.463%	149
10/19/2007	0.598%	82

The slope S=0.787% of 6/13/2007 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/13/2007	95.48
7/18/2007	95.60
9/20/2007	-
10/19/2007	94.94
Invert	95.60
SZF	95.60

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Site was flooded on 9/20/07. Limited data were collected.
(4) The invert of 10/19/07 survey was about 0.5ft lower than the other two surveyes. This may be the result of of degradation from the September flooding.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/13/2007	107.4	96.78	96.81	0.03	IFG4
2nd	7/18/2007	63.3	96.60	96.58	-0.02	IFG4
3rd	9/20/2007		98.23			
4th	10/19/2007	220.0	97.24	97.22	-0.02	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured during the 9/20/07 site visit due to flooding

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 63.3cfs to 220.0cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment
of n values was made at the stations where simulated velocity was greatly different from the measured
values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/13/2007	107.4	Y
7/18/2007	63.3	Y
9/20/2007		
10/19/2007	220.0	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are
all within reasonable ranges and appear to vary in normal trends.

River Kilometer: 24.68

Stream South Fork Koktuli River
Site: 04-SFK-RF2
Habitat Type: Riffle

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP
1st	7/17/2005	98.43	96.74	97.94
2nd	8/11/2005	98.43	96.74	97.93
3rd	9/8/2005	98.43	96.75	97.94
4th	7/6/2006	98.43	96.73	98.05
5th	4/12/2007	98.43	96.71	97.90

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevation changes between BM and HP were within ±0.03ft from 2005 to 2007.
(c) Small relative elevation changes suggest BM and HP were stable between 2005 and 2006.
(4) Photos of 4/12/07 trip showed the site was covered in snow and ice.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/17/2005	94.94
8/11/2005	94.48
9/8/2005	95.90
7/6/2006	94.88
4/12/2007	94.36

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/17/2005	
8/11/2005	76.8
9/8/2005	404.6
7/6/2006	125.4
4/12/2007	54.0

No discharge was surveyed during 7/17/07 site visit.

Photos of 4/12/07 site visit showed ice on banks and waters edge. Hydraulics may be impacted by ice.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/17/2005	0.159%	112.9
8/11/2005	0.330%	118.1
9/8/2005	0.140%	128.2
7/6/2006	0.250%	140.1
4/12/2007	0.373%	142

The slope S=0.330% of 8/11/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/17/2005	93.68
8/11/2005	93.68
9/8/2005	93.60
7/6/2006	93.58
4/12/2007	93.66
Invert	93.68
SZF	93.68

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

8/8/08: Initial WSE calibration using IFG4 shows the Froude number decreases as flow increases. This may have been caused by the flood plain near stage 94.8ft between two of the measured WSEs. To more accurately model the WSE, it is determined MANSQ be used because IFG4 does not take into account the abrupt bathymetric change as WSEs vary across the floodplain stage. To best characterize the WSE~Q rating curve relationship, MANSQ method was applied to different simulation flow ranges, as detailed in the following table As the result of this application (multiple ranges of flow), a composite rating curve was developed to describe the relationship between flows and WSEs for the entire range of simulation flows. The procedures for the composite curve is shown as follows.

	WSE (ft)			
Simulation Q (cfs)	Q=76.8 (β=-0.25)	Q=125.4 (β=0.0)	Q=404.6 (β=-1.0)	Composite
30	94.25	94.27	94.67	94.25
40	94.31	94.35	94.86	94.31
60	94.41	94.48	95.05	94.41
76.8	94.48	94.58	95.13	94.48
80	94.50	94.60	95.14	94.51
100	94.57	94.70	95.22	94.63
125.4	94.66	94.88	95.31	94.88
150	94.75	95.02	95.38	95.05
180	94.87	95.11	95.46	95.18
210	94.99	95.19	95.54	95.30
240	95.05	95.27	95.60	95.41
270	95.10	95.35	95.66	95.51
300	95.15	95.42	95.72	95.61
340	95.21	95.52	95.79	95.73
380	95.27	95.60	95.86	95.84
404.6	95.31	95.66	95.90	95.90
440	95.35	95.73	95.95	95.95
480	95.41	95.81	96.01	96.01
520	95.46	95.89	96.07	96.07
560	95.50	95.97	96.12	96.12
600	95.55	96.04	96.17	96.17

calibration notes

640	95.59	96.11	96.24	96.24
680	95.64	96.18	96.29	96.29
720	95.68	96.27	96.34	96.34
760	95.72	96.33	96.38	96.38
800	95.76	96.40	96.42	96.42
850	95.81	96.48	96.47	96.47
900	95.86	96.55	96.52	96.52
950	95.90	96.63	96.56	96.56
1000	95.95	96.70	96.61	96.61

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft)	calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR-1	TR-1	TR-1	
1st	7/17/2005		94.94			
2nd	8/11/2005	76.8	94.48	94.48	0.00	MANSQ
3rd	9/8/2005	404.6	95.90	95.90	0.00	MANSQ
4th	7/6/2006	125.4	94.88	94.88	0.00	MANSQ
5th	4/12/2007	54.0	94.36			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No discharge was measured on 7/17/05.
(d) Photos of 4/12/07 showed thick ice on banks and waters edge. Ice near shore had collapsed and fallen into the water, which should have backed up the WSE. Therefore the hydraulics will not be included in the modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 76.8cfs to 404.6cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/17/2005		
8/11/2005	76.8	Y
9/8/2005	404.6	Y
7/6/2006	125.4	Y
4/12/2007	54.0	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends as $Q < Q_{low}$=76.8cfs and as $Q > Q_{high}$=404.6cfs, the flow with stage about 1.0ft higher than the flood plain.
The Fr and n values, however, vary in opposite trends with flows between Q_{low} and Q_{high}. Since this only occurs within the range of the three measured flows, such trends reflects the actual hydraulic changes as flow varies.

Reach: B
Site: 04-SFK-RN2
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/17/2005	100.00	101.33	99.25
2nd	8/11/2005	100.00	101.32	99.26
3rd	9/8/2005	100.00	101.32	99.25
4th	7/6/2006	100.00	101.38	99.27
5th	4/12/2007	100.00	101.25	

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM and TP were within 0.02ft.
(c) Small changes of elevations indicated BM & TP were stable during the 2005-2006 period.
(d) Survey results of 4/12/07 were affected by ice and not included in modeling.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/17/2005	97.63
8/11/2005	97.26
9/8/2005	98.33
7/6/2006	97.55
4/12/2007	96.80

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/17/2005	
8/11/2005	76.1
9/8/2005	403.2
7/6/2006	123.4
4/12/2007	55.1

No discharge measurement on 7/17/05

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/17/2005	0.316%	142.4
8/11/2005	0.176%	125.3
9/8/2005	0.330%	194.2
7/6/2006	0.274%	117
4/12/2007	0.175%	97

The slope S=0.176% of 8/11/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/17/2005	95.47
8/11/2005	95.56
9/8/2005	95.43
7/6/2006	95.35
4/12/2007	95.10
Invert	95.56
SZF	95.56

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Bed profile comparison shows that 4/12/07 has a lower invert, which may have been the result of scour due to ice. Data of this date not used for analysis.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	7/17/2005		97.63			
2nd	8/11/2005	76.1	97.26	97.27	0.01	IFG4
3rd	9/8/2005	403.2	98.33	98.34	0.01	IFG4
4th	7/6/2006	123.4	97.55	97.53	-0.02	IFG4
5th	4/12/2007	55.1	96.80			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range.
(c) No discharge was measured on 7/17/05.
(d) Photos of 4/12/07 survey showed ice/snow on banks and waters edge. Hydraulics may have been impacted by the ice/snow and thus were not be used in the modeling analysis.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 76.1cfs to 403.2cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/17/2005		
8/11/2005	76.1	Y
9/8/2005	403.2	Y
7/6/2006	123.4	Y
4/12/2007	55.1	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends.

IFG4 Data Deck

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 04-SFK-IC2

Habitat Type: Island Complex

River Kilometer: 25.67

Stream: South Fork Koktuli River
Reach: B
Site: 04-SFK-IC2
Habitat Type: Island Complex

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/17/2005	100.00	97.97	98.68
2nd	8/12/2005	100.00	97.97	98.66
3rd	9/8/2005	100.00	97.97	98.67
4th	6/29/2006	100.00	98.11	98.70
5th	7/6/2006	100.00	98.50	98.69
6th	4/12/2007	100.00	98.64	98.69

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM and TP were within ±0.02ft over the 2005-2006 period. Small changes of elevations suggested both BM and TP were stable during that period.
(c) The relative elevation changes showed HP continued to raise from 2005 to 2007, which may be caused by frost heave No corrections for WSE's were needed because the datums were based on BM, not HP.

calibration notes

Measured WSE:

This transect is an island complex with three channels (Left, Center, Right). Each channel has multiple measured WSEs on both waters edge and maybe an additional one at center of the channel. Average of all measured WSEs in each channel is used as the representative WSE of that channel.

Date	WSE (ft)		
	Left	Center (main)	Right
7/17/2005	95.95	95.94	95.85
8/12/2005	95.71	95.61	95.48
9/8/2005	96.57	96.77	96.71
6/29/2006	96.03	95.99	95.91
7/6/2006	95.94	95.88	95.75
4/12/2007	95.64	95.48	95.44

WSEs of the center channel are used for modeling because it carries the majority of water. The bed profiles of the left and right channels were adjusted based on their WSE differences from the center channel.

Discharge:

Measured discharges of each channel are listed in the following table.

Date	Flow (cfs)			
	Left	Center (main)	Right	Total
7/17/2005				
8/12/2005	22.0	44.7	3.6	70.2
9/8/2005	135.9	232.7	67.0	435.6
6/29/2006				
7/6/2006	37.4	68.7	12.5	118.7
4/12/2007	16.3	26.4	0.5	43.2

No discharges were measured during the 7/17/05 and 6/29/06 site visits.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (ft/ft)		
	Left	Center (main channel)	Right
7/17/2005	0.407%	0.228%	0.12%
8/12/2005	0.179%	0.160%	0.16%
9/8/2005	0.506%	0.186%	0.24%
6/29/2006	0.425%	0.281%	0.22%
7/6/2006	0.417%	0.331%	0.44%
4/12/2007	0.504%	0.329%	NA

The slope S=0.160% of 8/12/2005 survey was used for hydraulic modeling.

Date	WSE Slope Distance (ft)		
	Left	Center	Right
7/17/2005	110.5	175.4	60.3
8/12/2005	61.5	27.5	83.6
9/8/2005	142.4	113.1	89
6/29/2006	127	142.3	82.1
7/6/2006	144.12	127	89
4/12/2007	136.8	60	NA

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/17/2005	94.22
8/12/2005	94.21
9/8/2005	94.27
6/29/2006	94.36
7/6/2006	94.18
4/12/2007	94.08
Invert	94.27
SZF	94.27

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Bed profiles were surveyed on 7/17/05 and 6/29/06, but their inverts were not used to determine SZF because there were no flows measured on these two dates.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	7/17/2005		95.94			
2nd	8/12/2005	70.2	95.61	95.61	0.00	IFG4
3rd	9/8/2005	435.6	96.77	96.77	0.00	IFG4
4th	6/29/2006		95.99			
5th	7/6/2006	118.7	95.88	95.87	-0.01	IFG4
6th	4/12/2007	43.2	95.48			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) No discharges were measured during the 7/17/05 and 6/29/06 site visits
(d) Photos of 4/12/07 site visit showed part of the channel was occupied by ice, and the transect profile comparison showed the channel width was smaller than those from the previous surveys. Both suggested the hydraulics (Q and WSE) surveyed on this date were affected by the ice and thus were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 70.2cfs to 435.6cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/17/2005		
8/12/2005	70.2	Y
9/8/2005	435.6	Y
6/29/2006		
7/6/2006	118.7	
4/12/2007	43.2	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges and appear to vary in normal trends.

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 05-SFK2-RF1

Habitat Type: Riffle

River Kilometer: 26.22

Stream: South Fork Koktuli River
Reach: B
Site: 05-SFK2-RF1
Habitat Type: Riffle

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	Trip	BM	HP	TP
1st	6/12/2005	1	100.00	100.95	100.46
2nd	6/13/2005	2	100.00		
3rd	7/17/2005	3	100.00	100.94	100.45
4th	8/11/2005	4	100.00	100.94	100.45
5th	7/6/2006	5	100.00	101.07	100.40
6th	4/11/2007	6	100.00	101.54	100.19

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between control pins were within 0.01ft in 2005
(c) The relative elevation changes indicated all control pins were disturbed in 2006 and 2007.
(d) No level loop was conducted on 6/13/05, a day after the pins were established.

Measured WSE:

Level loop of 7/6/06 indicated control pins were disturbed in 2006. It is not able to accurately determined the amount of disturbance to each pin using the surveyed elevations. Therefore, no corrections were made to the WSEs of 2006. Part of the transect was in ice during the 2007 site visit, and thus the hydraulics data were not used for modeling.
There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/12/2005	99.01
6/13/2005	98.99
7/17/2005	98.74
8/11/2005	98.51
7/6/2006	98.62
4/11/2007	98.17

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/12/2005	
6/13/2005	195.3
7/17/2005	
8/11/2005	71.6
7/6/2006	109.2
4/11/2007	42.4

Only partial transect flow was measured in 4/11/07 trip, because part of the channel was still occupied by ice at the time of survey.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/12/2005	0.409%	185.7
6/13/2005	0.410%	178
7/17/2005	0.514%	183
8/11/2005	0.386%	119.1
7/6/2006	0.444%	141.8
4/11/2007	0.336%	125

The slope S=0.410% of 6/13/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/12/2005	97.46
6/13/2005	97.49
7/17/2005	
8/11/2005	97.51
7/6/2006	97.42
4/11/2007	97.27
Invert	97.51
SZF	97.51

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/17/05 and only partial transect was surveyed on 4/11/07 due to shore ice.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/12/2005		99.01			
2nd	6/13/2005	195.3	98.99	98.97	-0.02	IFG4
3rd	7/17/2005		98.74			
4th	8/11/2005	71.6	98.51	98.48	-0.03	IFG4
5th	7/6/2006	109.2	98.62	98.66	0.04	IFG4
6th	4/11/2007	42.4	98.17			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharge was collected on 6/12/05 and only partial flow measured on 4/11/07 due to shore ice
(d) Photos of 4/11/07 site visit showed part of the channel was still occupied by ice.
Hydraulics were affected by the ice and thus data were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 71.6cfs, 109.2cfs, and 195.3cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/12/2005		
6/13/2005	195.3	Y
7/17/2005		
8/11/2005	71.6	Y
7/6/2006	109.2	Y
4/11/2007	42.4	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

River Kilometer: 27.03

Stream: South Fork Koktuli River
Reach: B
Site: 05-SFK2-RN4
Habitat Type: Run

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP
1st	6/11/2005	100.00	99.43	101.32
2nd	6/13/2005	100.00		
3rd	7/17/2005	100.00	99.41	101.30
4th	8/11/2005	100.00	99.42	101.32
5th	7/6/2006	100.00	99.43	101.35
6th	4/11/2007	100.00	99.51	101.74

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
(b) No level loop conducted on 6/13/05, two days after the pins were initially set up.
(c) Relative elevation changes between BM and HP were within ±0.01ft during 2005-2006, indicating the pins were stable during the period.
(c) Results of 4/11/07 level loop suggested pins were disturbed in 2007. Not able to determine the datum elevation shift, so hydraulics of this date not were used for modeling.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

	WSE (ft)		
Date	L. Off Ch.	Center (main)	R. Off Ch.
6/11/2005	97.68	98.24	98.37
6/13/2005	97.73	98.18	97.39
7/17/2005	97.67	97.75	98.01
8/11/2005	97.57	97.29	97.68
7/6/2006	na	97.61	98.11
4/11/2007	na	96.96	na

Off-channel hydraulics were not considered in the in-stream flow analysis

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Flow (cfs)			
	L. Off Ch.	Center (main)	R. Off Ch.	Total
6/11/2005				
6/13/2005		182.5		182.5
7/17/2005				
8/11/2005		59.2	0.0	59.2
7/6/2006		102.0		102.0
4/11/2007		34.4		34.4

(1) No discharges were taken on 6/11/05 and 7/17/05

(2) Right and left off-channels were either no flow or dry during the site visits. Off-channel hydraulics were not considered for in-stream flow analysis

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (ft)	WSE Slope Distance (ft)
6/11/2005	0.163%	208.2
6/13/2005	0.180%	211.4
7/17/2005	0.118%	372.0
8/11/2005	0.117%	273.5
7/6/2006	0.108%	186.0
4/11/2007	0.071%	211.4

The slope S=0.180% of 6/13/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Main Channel Invert (ft)
6/11/2005	95.42
6/13/2005	95.28
7/17/2005	
8/11/2005	95.39
7/6/2006	95.41
4/11/2007	95.46
Invert	95.46
SZF	95.46

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) The invert of 6/11/05 survey was not used to determine SZF because of no flow measured.
(4) No transect profile was surveyed in 7/17/05 trip.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR-1	calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/11/2005		98.24

3rd	7/17/2005		97.75			
4th	8/11/2005	59.2	97.29	97.27	-0.02	IFG4
5th	7/6/2006	102.0	97.61	97.65	0.04	IFG4
6th	4/11/2007	34.4	96.96	96.95	-0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharges were measured in 6/11/05 and 7/17/05 trips
(d) Photos of 4/11/07 site visit showed channel clear of ice and banks with only residual snow. Surveyed data were included in hydraulic modeling.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 34.4cfs, 59.2cfs 102.0cfs, and 182.5cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the four calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/11/2005		
6/13/2005	182.5	Y
7/17/2005		
8/11/2005	59.2	Y
7/6/2006	102.0	Y
4/11/2007	34.4	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 05-SFK2-IC1

Habitat Type: Island Complex

River Kilometer: 27.42

Stream: South Fork Koktuli River
Reach: B
Site: 05-SFK2-IC1
Habitat Type: Island Complex

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	Trip	BM	HP	AP	TP
1st	6/13/2005	1	100.00	98.61	99.19	98.54
2nd	7/17/2005	2	100.00	98.61	99.19	98.53
3rd	8/10/2005	3	100.00	98.62	99.20	98.54
4th	7/6/2006	4	100.00	98.62	99.19	98.57
5th	4/11/2007	5	100.00	98.60	99.19	98.67

(a) Elevations of control pins (BM, HP, AP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between control pins (except TP) were within ±0.01ft over the 2 years period. Small changes of elevations suggested the control pin datum was stable.
(c) The relative elevation changes showed TP continued to raise from 2005 to 2007, which may be caused by frost heave No corrections for WSE's were needed because the survey datum was based on BM, not TP.
(d) AP, angle pin, was a working pin located on the island in the stream between HP and TP.

calibration notes

Measured WSE:

This transect is an island complex with a right channel and a left channel. Right channel was designated as main channel because it carried the majority of water. There were multiple WSEs surveyed across each channel during each site visit. The average of all measured WSEs of each channel is used as the representative WSE of that channel for hydraulic modeling.

Date	WSE (ft)	
	Left	Main-R
6/13/2005	97.51	96.75
7/17/2005	96.75	96.32
8/10/2005	96.12	96.03
7/6/2006	95.87	96.17
4/11/2007	95.67	95.58

The bed profiles of left channel from each site visit were adjusted based on their WSE differences from the right channel. This is to meet the requirement of one-WSE across the transect when modeling using PHABSIM.

Discharge:

All measured discharges for each channel and the entire transect are summarized in the following table.

Date	Flow (cfs)		
	Left	Right (main)	Total
6/13/2005	22.2	165.8	188.1
7/17/2005			
8/10/2005	16.3	41.9	58.2
7/6/2006	34.2	64.9	99.1
4/11/2007	11.5	13.7	25.2

No discharge was measured during the 7/17/05 site visit.
Photos of 4/11/07 site visit showed residual ice on banks and near shore, but the transect was clear of ice. The ice impact should be minimal and thus the surveyed hydraulics of this date were included in modeling.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Left Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/13/2005	-0.013%	157.5
7/17/2005	-0.005%	184
8/10/2005	0.022%	179.4
7/6/2006	0.267%	89.9
4/11/2007	0.179%	156.7

Right (Main) Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/13/2005	0.380%	147.5
7/17/2005	0.381%	97
8/10/2005	0.357%	100.8
7/6/2006	0.409%	90.5
4/11/2007	0.332%	144.6

The slope S=0.380% of 6/13//2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/13/2005	94.95
7/17/2005	
8/10/2005	95.11
7/6/2006	94.68
4/11/2007	94.73
Invert	95.11
SZF	95.11

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/17/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/13/2005	188.1	96.75	96.79	0.04	IFG4
2nd	7/17/2005		96.32			
3rd	8/10/2005	58.2	96.03	95.92	**-0.11**	IFG4
4th	7/6/2006	99.1	96.17	96.24	0.07	IFG4
5th	4/11/2007	25.2	95.58	95.59	0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.11ft is unusually high compared to the other sites.
(c) No discharge was measured during the 7/17/05 site visit.
(d) Photos of 4/11/07 site visit showed residual ice on banks and waters edge. Not expected ice to have much significant impact on hydraulics, and thus calibration included the hydraulics surveyed on this date.

calibration notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 25.2cfs to 188.1cfs.
Each of the four measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity
profile was used to simulate velocity for a range of flows in the vicinity of the measured flow.
For the four calibrated velocity profiles, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/13/2005	188.1	Y
7/17/2005

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were
all within reasonable ranges. The Manning's n and Froude number, however, did not vary in the normal directions
for the entire range of simulation flows. This may have been caused by (1) the complex multiple-channel
bathymetry to which the Froude number definition (Fr=V_ave/sqrt(g*A/T), Chow, 1959) for a single-channel
transect may not be applicable and (2) the very different WSE levels (as much as 0.76ft in elevation difference)
and velocity distributions across the two channels in the transect, where the definition of uniform flow, as
required by the Manning's equation, may not be completely satisfied. As the result, the calculated Manning's n
values for characterizing the channel roughness may not reflect the actual flow resistance of each individual channel.

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 05-SFK2-RN7

Habitat Type: Run

River Kilometer: 28.07

Stream: South Fork Koktuli River
Reach: B
Site Name: 05-SFK2-RN7
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/12/2005	1	100.00	98.83	101.06
2nd	7/16/2005	2	100.00	98.82	101.04
3rd	8/11/2005	3	100.00	98.83	101.05
4th	7/6/2006	4	100.00	98.85	101.21
5th	4/11/2007	5	100.00	98.87	101.47

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM and HP were within ±0.02ft during the 2005-2006 period, indicating BM and HP were relatively stable during that period.
(c) 4/11/07 survey results showed HP and TP elevations increased 0.02ft and 0.25ft, respectively, from 2006. The small change in HP suggested BM and HP were still relatively stable. The elevation change of TP was significant, but no corrections were needed for the 2007 WSEs, because elevation datum was based on BM.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/12/2005	96.70
7/16/2005	96.33
8/11/2005	95.95
7/6/2006	96.20
4/11/2007	95.65

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/12/2005	191.1
7/16/2005	
8/11/2005	52.4
7/6/2006	91.9
4/11/2007	24.1

Substrate was surveyed on 7/16/05, but no discharge was measured on the same date.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/12/2005	0.227%	145.5
7/16/2005	0.199%	135.8
8/11/2005	0.131%	99.3
7/6/2006	0.210%	119.2
4/11/2007	0.079%	101.8

The slope S=0.227% of 6/12/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/12/2005	94.20
7/16/2005	
8/11/2005	94.35
7/6/2006	94.30
4/11/2007	94.25
Invert	94.35
SZF	94.35

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in 7/16/05 trip.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR1	calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/12/2005	191.1	96.70	96.67	-0.03	IFG4
2nd	7/16/2005		96.33			
3rd	8/11/2005	52.4	95.95	95.95	0.00	IFG4
4th	7/6/2006	91.9	96.20	96.23	0.03	IFG4
5th	4/11/2007	24.1	95.65	95.64	-0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range
(c) No discharge was measured in 7/16/05 trip
(d) Photos of 4/11/07 site visit showed scattered ice on waters edge. Don't expect the residual ice had significant impact on hydraulics, and thus the surveyed data were included in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 24.1cfs, 52.4cfs 91.9cfs, and 191.1cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/12/2005	191.1	Y
7/16/2005		
8/11/2005	52.4	Y
7/6/2006	91.9	Y
4/11/2007	24.1	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 05-SFK2-RN6

Habitat Type: Run

River Kilometer: 29.24

Stream: South Fork Koktuli River
Reach: B
Site Name: 05-SFK2-RN6
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/12/2005	1	100.00	100.84	100.51
2nd	7/16/2005	2	100.00	100.84	100.51
3rd	8/10/2005	3	100.00	100.84	100.51
4th	7/6/2006	4	100.00	100.82	100.46
5th	4/11/2007	5	100.00	100.85	100.43

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM and HP were within 0.02ft during the 2005-2007 period, indicating BM and HP were stable in this period.
(c) TP of 4/11/07 survey showed 0.08ft elevation shift, but the elevation datum was still considered stable because small relative elevation changes between BM and HP. No corrections to the surveyed WSEs were needed because elevations were based on BM.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/12/2005	98.70
7/16/2005	98.28
8/10/2005	97.77
7/6/2006	98.01
4/11/2007	97.10

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/12/2005	185.8
7/16/2005	
8/10/2005	44.2
7/6/2006	80.6
4/11/2007	16.1

Substrate was surveyed on 7/16/05, but no discharge was measured on the same date.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/12/2005	0.219%	90
7/16/2005	0.106%	180
8/10/2005	0.011%	190.4
7/6/2006	0.053%	151.5
4/11/2007	-0.024%	165.4

The slope S=0.219% of 6/12/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/12/2005	95.20
7/16/2005	
8/10/2005	95.17
7/6/2006	95.21
4/11/2007	95.10
Invert	95.21
SZF	95.21

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in 7/16/05 trip.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR	TR	TR	
1st	6/12/2005	185.8	98.70	98.72	0.02	IFG4
2nd	7/16/2005		98.28			
3rd	8/10/2005	44.2	97.77	97.67	-0.10	IFG4
4th	7/6/2006	80.6	98.01	98.06	0.05	IFG4
5th	4/11/2007	16.1	97.10	97.12	0.02	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.10ft is marginally acceptable.
(c) No discharge was measured in 7/16/05 trip
(d) Photos of 4/11/07 site visit showed channel was clear of ice and there was only scattered ice on waters edge. Don't expect the residual ice had any significant impact on hydraulics.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 16.1cfs, 44.2cfs 80.6cfs, and 185.8cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/12/2005	185.8	Y
7/16/2005		
8/10/2005	44.2	Y
7/6/2006	80.6	Y
4/11/2007	16.1	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 05-SFK2-RN3

Habitat Type: Run

River Kilometer: 30.19

Stream: South Fork Koktuli River
Reach: B
Site: 05-SFK2-RN3
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/11/2005	1	100.00	100.24	99.12
2nd	6/13/2005	2	100.00		
3rd	7/18/2005	3	100.00	100.27	99.13
4th	8/11/2005	4	100.00	100.28	99.14
5th	6/29/2006	5	100.00	100.28	99.15
6th	7/7/2006	6	100.00	100.25	99.13
7th	4/11/2007	7		100.25	99.22

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
No level loop conducted on 6/13/05, two days after the pins were initially set up.
(b) Relative elevation changes between BM and TP were within ±0.02ft during 2005-2006, indicating the pins were stable during that period.
(c) BM of 4/11/07 was under 8ft of snow. Hydraulics not used for modeling due to ice impact.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative for the modeling.

Date	WSE (ft)
6/11/2005	97.01
6/13/2005	96.94
7/18/2005	96.62
8/11/2005	96.29
6/29/2006	96.56
7/7/2006	96.55
4/11/2007	95.94

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/11/2005	
6/13/2005	163.9
7/18/2005	
8/11/2005	36.8
6/29/2006	
7/7/2006	80.5
4/11/2007	20.8

The 4/11/07 flow was inomplete due to anchor ice near shore.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/11/2005	0.094%	170
6/13/2005	0.059%	153.7
7/18/2005	0.044%	158
8/11/2005	0.006%	155.8
6/29/2006	0.235%	115
7/7/2006	0.039%	128.4
4/11/2007	0.020%	153.7

The slope S=0.059% of 6/13/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/11/2005	93.07
6/13/2005	93.04
7/18/2005	
8/11/2005	93.09
6/29/2006	92.92
7/7/2006	93.05
4/11/2007	93.04
Invert	93.09
SZF	93.09

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) The inverts from the 6/11/05 and 6/29/06 surveys were not used to determine SZF because of no flows measured.
(4) The 7/18/05 site visit has no bed profile survey.
(5) The invert of 4/11/07 survey was not used to determine SZF because of incomplete transect measurement due to ice on waters edge.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/11/2005		97.01			
2nd	6/13/2005	163.9	96.94	96.92	-0.02	IFG4
3rd	7/18/2005		96.62			
4th	8/11/2005	36.8	96.29	96.27	-0.02	IFG4
5th	6/29/2006		96.56			
6th	7/7/2006	80.5	96.55	96.60	0.05	IFG4
7th	4/11/2007	20.8	95.94			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.05ft is within acceptable range.
(c) No discharges were measured in 6/11/05, 7/18/05, and 6/29/06 trips
(d) Only partial flow was measured on 4/11/07 due to anchor ice on waters edge.
Photos indicated the hydraulics was affected by the ice and, as the result, the measured hydraulics were not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 36.8cfs, 80.5cfs, and 163.9cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/11/2005		
6/13/2005	163.9	Y
7/18/2005		
8/11/2005	36.8	Y
6/29/2006		
7/7/2006	80.5	Y
4/11/2007	20.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

River Kilometer: 31.37

Stream: South Fork Koktuli River
Reach: B
Site Name: 05-SFK2-RN5
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/12/2005	1	100.00	99.40	99.54
2nd	7/16/2005	2	100.00	99.41	99.55
3rd	8/10/2005	3	100.00	99.41	99.54
4th	7/7/2006	4	100.00	99.38	99.58
5th	4/11/2007	5	100.00	99.43	99.85

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM and HP were no more than 0.03ft during the 2005-2007 period. Small changes indicated BM were stable during that period.
(c) TP of 4/11/07 survey showed more than 1/4ft elevation increase. No corrections to WSEs were needed because the elevation datum was referenced to BM.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/12/2005	96.89
7/16/2005	93.33
8/10/2005	95.84
7/7/2006	96.24
4/11/2007	95.44

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/12/2005	177.3
7/16/2005	
8/10/2005	33.2
7/7/2006	70.8
4/11/2007	7.7

No flow was measured on 7/16/05.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/12/2005	0.122%	212.7
7/16/2005	0.083%	181.4
8/10/2005	0.043%	138
7/7/2006	0.011%	93.7
4/11/2007	0.018%	113

The slope S=0.122% of 6/12/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/12/2005	93.89
7/16/2005	
8/10/2005	93.94
7/7/2006	94.04
4/11/2007	94.04
Invert	94.04
SZF	94.94

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in the 7/16/05 trip

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR1	calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/12/2005	177.3	96.89	96.87	-0.02	IFG4
2nd	7/16/2005		93.33			
3rd	8/10/2005	33.2	95.84	95.87	0.03	IFG4
4th	7/7/2006	70.8	96.24	96.23	-0.01	IFG4
5th	4/11/2007	7.7	95.44	95.43	-0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured in 7/16/05 trip
(d) Photos of 4/11/07 site visit showed channel was clear of ice but there was scattered ice on waters edge. Don't expect the residual ice had significant impact on hydraulics, and therefore the surveyed hydraulics were included ifor modeling.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 7.7cfs, 33.2cfs 70.8cfs, and 177.3cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/12/2005	177.3	Y
7/16/2005		
8/10/2005	33.2	Y
7/7/2006	70.8	Y
4/11/2007	7.7	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

Site: 05-SFK2-RN2
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	6/11/2005	100.00	100.57	101.89
2nd	6/13/2005			
3rd	7/18/2005	100.00	100.57	101.89
4th	8/10/2005	100.00	100.57	101.89
5th	6/29/2006	100.00	100.59	101.89
6th	7/7/2006	100.00	100.59	101.90
7th	4/10/2007	100.00	100.63	101.90

(a) Elevation of control pins (BM. HP, TP) are from the first half of each level loop survey
No level loop was conducted on 6/13/05, two days after the pins were initially set up.
The later level loop surveys in 7/05 & 8/05 showed the control pins were stable in 2005.
(b) Relative elevation changes between BM and TP were within ±0.01ft during 2005-2007.
Small changes of elevations indicated the elevation datum was stable.
(c) Survey results of 4/10/07 were affected by ice and not included in modeling.
(d) Small relative elevation changes in HP in 2007. No corrections to the WSEs were needed because the datum was not based on HP.

calibration notes

Measured WSE:

This transect is an island complex with a main channel and a side channel.
Multiple WSEs were surveyed across the main channel, and only one WSE measured in the side channel for each flow. The following table summarizes the representative WSEs of each channel.
The WSE of main channel is the average of right WSE, mid WSE, and left WSE of each flow.

	WSE (ft)		
Date	Main channel	Side channel	Off channel
6/11/2005	98.66	98.62	99.65
6/13/2005	98.56	98.53	99.59
7/18/2005	98.15	98.44	99.35
8/10/2005	97.74	98.41	99.03
6/29/2006	98.19		
7/7/2006	98.07	98.43	99.19
4/10/2007	97.22		

Discharge:

All measured discharges are listed in the following table.

	Flow (cfs)			
Date	Main channel	Side channel	Off channel	Total Q (cfs)
6/11/2005				
6/13/2005	151.0	0.0	0.0	151.0
7/18/2005				
8/10/2005	34.9	0.0	-0.1	34.7
6/29/2006				
7/7/2006	71.2	0.0	-0.3	70.9
4/10/2007	5.2			5.2

Off-channel flows were not included for modeling

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (ft)	WSE Slope Distance (ft)
6/11/2005	0.236%	275.5
6/13/2005	0.233%	240
7/18/2005	0.240%	242
8/10/2005	0.201%	214
6/29/2006	0.120%	100
7/7/2006	0.099%	141.5
4/10/2007	0.017%	116.2

The slope S=0.233% of 6/13/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/11/2005	96.51
6/13/2005	96.46
7/18/2005	
8/10/2005	96.24
6/29/2006	96.38
7/7/2006	96.27
4/10/2007	96.62
Invert	96.46
SZF	96.46

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) The inverts from the 6/11/05, 7/18/05, 6/29/06 surveys were not used to determine SZF because of no flows measured.
(4) The invert of 4/10/07 survey was not used to determine SZF because of ice impact and incomplete transect measurement.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/11/2005		98.66			
2nd	6/13/2005	151.0	98.56	98.56	0.00	IFG4
3rd	7/18/2005		98.15			
4th	8/10/2005	34.7	97.74	97.74	0.00	IFG4
5th	6/29/2006		98.19			
6th	7/7/2006	70.9	98.07	98.08	0.01	IFG4
7th	4/10/2007	5.2	97.22			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.01ft is within the acceptable range.
(c) No discharges were measured in the 6/11/05, 7/18/05, and 6/29/06 trips
(d) Only partial flow was measured on 4/10/07 possibly due to anchor ice.
No photos available for the 4/10/07 site visit, but the photos taken at the nearby site (05-SFK2-PL1), less than 1 mile away, showed the stream bank was covered in snow and anchor ice in the channel. This suggested the hydraulics of the current site were affected by the ice and, as the result, the measured hydraulics were not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 34.7cfs, 70.9cfs, and 151.0cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/11/2005		
6/13/2005	151.0	Y
7/18/2005		
8/10/2005	34.7	Y
6/29/2006		
7/7/2006	70.9	Y
4/10/2007	5.2	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

IFG4 Data Deck

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 05-SFK2-PL1

Habitat Type: Pool

River Kilometer: 33.16

Stream: South Fork Koktuli River
Reach: B
Site: 05-SFK2-PL1
Habitat Type: Pool

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	7/24/2005	1	100.00	98.12	98.08
2nd	8/10/2005	2	100.00	98.11	98.07
3rd	9/8/2005	3	100.00	98.14	98.10
4th	7/7/2006	4	100.00	98.14	98.12
5th	4/10/2007	5	100.00	98.13	98.28

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Relative elevation changes between BM & HP were within ±0.02ft over the 2005-2007 2 year period. Small changes of elevations suggested BM was stable.
(c) The relative elevation changes showed TP was raised by more than 0.15ft in 2007, which may be caused by frost heave. No corrections for WSE's were needed, because the survey datum was based on BM, not TP.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/24/2005	95.49
8/10/2005	95.16
9/8/2005	96.85
7/7/2006	95.79
4/10/2007	94.06

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/24/2005	
8/10/2005	13.1
9/8/2005	212.6
7/7/2006	41.3
4/10/2007	

No discharges were measured during the 7/24/05 and 4/10/07 trips.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/24/2005	-0.005%	186.4
8/10/2005	-0.009%	230.2
9/8/2005	0.015%	193.6
7/7/2006	0.039%	228.2

Negative longitudinal WSE slopes of 7/24/05 and 8/10/05 were due to measurement errors. The flow on these two days were very low (only 13.1cfs on 8/10/05), and a slight error in WSE survey could have caused the slopes to become negative.
The slope S=0.015% of 9/8/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/24/2005	93.11
8/10/2005	93.16
9/8/2005	93.05
7/7/2006	93.19
4/10/2007	NA
Invert	93.19
SZF	93.19

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 4/10/07 when the site was in snow/ice.
Limited data were collected on this date.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR-1	Calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	7/24/2005		95.49			
2nd	8/10/2005	13.1	95.16	95.17	0.01	IFG4
3rd	9/8/2005	212.6	96.85	96.88	0.03	IFG4
4th	7/7/2006	41.3	95.79	95.75	-0.04	IFG4
5th	4/10/2007		94.06			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharges were measured in 7/24/05 and 4/10/07 trip.
(d) Photos of 4/10/07 site visit showed the stream was almost entirely covered in ice.
Only limited hydraulic data were collected. Data were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, including 13.1cfs, 41.3cfs, and 212.6cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/24/2005		
8/10/2005	13.1	Y
9/8/2005	212.6	Y
7/7/2006	41.3	Y
4/10/2007		

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

Stream: South Fork Koktuli River

Reach: SFK-B

Site/TR: 05-SFK2-RN1

Habitat Type: Run

River Kilometer: 33.80

Stream: South Fork Koktuli River
Reach: B
Site: 05-SFK2-RN1
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/11/2005	1	100.00	101.71	99.54
2nd	6/14/2005	2	100.00		
3rd	7/16/2005	3	100.00	101.71	99.55
4th	8/10/2005	4	100.00	101.70	99.54
5th	7/7/2006	5	100.00	101.69	99.49

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey
(b) Max relative elevation changes between control pins were 0.01ft in 2005, and 0.05ft in 2006.
(c) The elevation changes indicated control pins were slightly disturbed in 2006, and adjustments are needed to correct the 2006 WSEs to the 2005 datum. The BM may have been raised by 0.02ft to 0.05ft, and, after preliminary modeling results, it was decided the HI of 2006 be increased by 0.05ft to convert to the same elevation datum as the three surveys in 2005.
(c) No level loop was conducted on 6/14/05, three days after the pins were initially established Survey of 7/16/05 suggested the pins were not disturbed on 6/14/05.

Measured WSE:

Average of all measured WSEs (Right, mid, and Left) is used as transect representative WSE.
The 2006 WSE below has reflected the elevation datum adjustment of 0.05ft.

Date	WSE (ft)
6/11/2005	97.52
6/14/2005	97.45
7/16/2005	97.11
8/10/2005	96.62
7/7/2006	96.96

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/11/2005	
6/14/2005	121.5
7/16/2005	
8/10/2005	11.1
7/7/2006	47.2

No flows were surveyed on 6/11/05 and 7/16/05

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/11/2005	0.416%	158.6
6/14/2005	0.321%	54
7/16/2005	0.569%	153
8/10/2005	0.127%	63
7/7/2006	0.282%	78

The slope S=0.321% of 6/14/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/11/2005	95.77
6/14/2005	95.75
7/16/2005	
8/10/2005	95.62
7/7/2006	95.66
Invert	95.75
SZF	96.15

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) The invert of 6/11/05 survey was not used to determine SZF because of no flow measured

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR-1	Calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/11/2005		97.52			
2nd	6/14/2005	121.5	97.45	97.41	-0.04	IFG4
3rd	7/16/2005		97.11			
4th	8/10/2005	11.1	96.62	96.61	-0.01	IFG4
5th	7/7/2006	47.2	96.96	97.00	0.04	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharges were measured on 6/11/05 and 7/16/05

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 11.1cfs, 47.2cfs, and 121.5cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/11/2005		
6/14/2005	121.5	Y
7/16/2005		
8/10/2005	11.1	Y
7/7/2006	47.2	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/14/2005	1	100.00	99.01	101.43
2nd	7/17/2005	2	100.00	99.01	101.43
3rd	8/10/2005	3	100.00	99.00	101.42
4th	7/7/2006	4	100.00	99.04	101.45

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between control pins were within 0.02ft during the 2005-2006 period. Small elevation changes indicated the BM were stable.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/14/2005	96.10
7/17/2005	95.56
8/10/2005	94.33
7/7/2006	95.21

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/14/2005	71.6
7/17/2005	
8/10/2005	
7/7/2006	16.9

Substrate was surveyed on 7/17/05, but no discharge was measured on the same day.
Depth was too shallow for velocity measurement during the 8/10/05 trip.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/14/2005	0.094%	159.2
7/17/2005	0.076%	79.0
8/10/2005	0.000%	59.6
7/7/2006	0.163%	153.2

The slope S=0.094% of 6/14/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/14/2005	94.00
7/17/2005	
8/10/2005	
7/7/2006	93.81
Invert	94.00
SZF	94.00

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in 7/17/05 trip.
(4) Only partial bed profile was surveyed on 8/10/05 due to insufficient water depth for velocity probe.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR1	calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/14/2005	71.6	96.10	96.10	0.00	IFG4
2nd	7/17/2005		95.56			
3rd	8/10/2005		94.33			
4th	7/7/2006	16.9	95.21	95.21	0.00	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No discharge was measured in 7/17/05 trip
(d) Partial flow was measured in 8/10/05 trip due to water depth too shallow.
(e) This transect has only two pairs of WSE~Q available, but Log-log (IFG4 method) relationship was still assumed when calibrating the WSE~Q rating curve. Usually MANSQ would have been applied for the calibration when only two pairs of WSE~Q can be used, but MANSQ calibration results showed large (~0.1ft) calibration errors. To minimize the calbration error, IFG4's log-log relationship was applied.

calibration notes

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/14/2005	71.6	Y
7/17/2005		
8/10/2005		
7/7/2006	16.9	Y

(3) Velocity calibration

This site has one transect with two complete velocity/discharge measurements, including 16.9cfs and 71.6cfs. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the two calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and generally varied with normal trends.

Site Name: 04-SFK-RF1
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	6/29/2005	100.00	97.99	98.06
2nd	7/16/2005	100.00	97.99	98.07
3rd	8/9/2005	100.00	98.01	97.89
4th	6/29/2006	100.00	97.87	98.22
5th	7/6/2006	100.00	97.85	98.21

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and HP were within 0.02ft in 2005 which indicated BM was stable.
TP moved 0.17ft (=98.06-97.89) in 2005, but since the survey elevation was based on BM, there is no need to adjust the surveyed WSEs for the TP movement.
(c) Either HP or BM was disturbed in 2006, resulting in more than 0.15ft relative elevation change between these two pins. Not able to determine which pins had moved from the survey results. Assumed BM was stable and therefore made no corrections to the 2006 WSEs.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/29/2005	95.27
7/16/2005	94.99
8/9/2005	94.57
6/29/2006	95.14
7/6/2006	95.02

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/29/2005	35.6
7/16/2005	
8/9/2005	6.0
6/29/2006	
7/6/2006	21.6

No discharges were measured on 7/16/05 and 6/29/06.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/29/2005	0.385%	39
7/16/2005	0.376%	63.8
8/9/2005	1.541%	26.6
6/29/2006	0.413%	46
7/6/2006	0.442%	43

The steep slope of 8/9/05 was due to the sudden WSE drop across a gravel XS, a hydraulic control during low flows, just below the transect. During higher flows the hydraulic control was submerged and no WSE discontinuity would occur, resulting in milder longitudinal WSE slope.

The slope S=0.385% of 6/29/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/29/2005	93.77
7/16/2005	
8/9/2005	93.67
6/29/2006	93.86
7/6/2006	93.92
Invert	93.92
SZF	93.92

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in the 7/16/05 trip.
(4) Invert of 6/29/06 survey was not used to determine SZF because of no flow measured on that day.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/29/2005	35.6	95.27	95.31	0.04	IFG4
2nd	7/16/2005		94.99			
3rd	8/9/2005	6.0	94.57	94.65	0.08	IFG4
4th	6/29/2006		95.14			
5th	7/6/2006	21.6	95.02	95.07	0.05	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No discharges were measured during the 7/16/05 and 6/29/06 site visits.

calibration notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, including 6.0cfs, 21.6cfs, and 35.6cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/29/2005	35.6	Y
7/16/2005		
8/9/2005	6.0	Y
6/29/2006		
7/6/2006	21.6	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and generally varied with normal trends.

Stream: South Fork Koktuli River

Reach: SFK-C

Site/TR: 04-SFK-PL1

Habitat Type: Pool

River Kilometer: 36.58

Stream: South Fork Koktuli River
Reach: C
Site Name: 04-SFK-PL1
Habitat Type: Pool

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/29/2005	1	100.00	97.85	97.95
2nd	7/15/2005	2	100.00	97.85	97.95
3rd	8/9/2005	3	100.00	97.87	97.96
4th	6/27/2006	4	100.00	97.83	97.80

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and HP were within ±0.02ft during the 2005-2006 period. Small elevation changes indicated the survey datum were stable.
(b) The 2006 level loop indicated TP may have sunk 0.15ft. No corrections were needed for the 2006 WSEs because the datum was based on BM and HP, both of which were considered stable in 2006.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/29/2005	95.55
7/15/2005	95.33
8/9/2005	94.79
6/27/2006	95.63

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/29/2005	37.4
7/15/2005	
8/9/2005	5.2
6/27/2006	32.6

No discharge was measured on 7/15/05.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/29/2005	0.022%	46
7/15/2005	0.139%	28.7
8/9/2005	0.024%	42
6/27/2006	0.000%	55.7

The slope S=0.022% of 6/29/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/29/2005	92.55
7/15/2005	
8/9/2005	92.59
6/27/2006	92.53
Invert	92.59
SZF	92.59

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in 7/17/05 trip.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/29/2005	37.4	95.55	95.63	0.08	IFG4
2nd	7/15/2005		95.33			
3rd	8/9/2005	5.2	94.79	94.79	0.00	IFG4
4th	6/27/2006	32.6	95.63	95.56	-0.07	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.08ft is marginally acceptable.
(c) No discharge was measured during the 7/15/05 site visit.
(d) The "Measured Q vs.WSE" figure shows WSE did not increase with increasing flows from 32.6cfs to 37.4cfs. Checked all surveyed data but was unable to determine the cause. From the plot, it appears the errors are within 0.10ft for either of the two WSE~Q data sets. Because the error was not too significant, it was decided to keep both data sets in hydraulic modeling.

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, including 5.2cfs, 32.6cfs, and 37.4cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/29/2005	37.4	Y
7/15/2005		
8/9/2005	5.2	Y
6/27/2006	32.6	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary in normal trends.

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/29/2005	1	100.00	98.59	99.19
2nd	7/16/2005	2	100.00	98.61	99.21
3rd	8/9/2005	3	100.00	98.62	99.20
4th	7/6/2006	4	100.00	98.68	99.27

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) The relative elevations between TP and HP showed they were relatively stable with consistent elevation difference between 0.58ft and 0.60ft throughout the 1+ year survey period.
(c) Relative elevation changes between the control pins indicated the HP and TP elevations continued to rise from the initial pin setup in 6/2005 to the last site visit in 7/2006.
(d) The survey results indicated BM continued to sink gradually, resulting in higher elevations of HP and TP each time of survey following the initial pin setup. The data indicated BM sank 0.02ft in 2005 and 0.08ft in 2006.
(e) To compensate for the movement of BM, the elevation datum, all surveyed WSEs other than the initial ones were adjusted with the sinking amount of BM to make all elevations referenced to the same datum.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/29/2005	95.56
7/16/2005	95.33
8/9/2005	94.77
7/6/2006	95.25

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/29/2005	37.6
7/16/2005	
8/9/2005	5.5
7/6/2006	22.9

No discharge was measured on 7/16/05.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/29/2005	0.128%	47
7/16/2005	0.043%	47
8/9/2005	-0.043%	47
7/6/2006	-0.018%	55

Negative slopes may be due to measurement errors or mislabeling of upstream and downstream. Velocity head was less than 0.01ft, too small to result in negative WSE slope. The slope S=0.128% of 6/29/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/29/2005	93.26
7/16/2005	
8/9/2005	93.17
7/6/2006	93.25
Invert	93.26
SZF	93.26

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in the 7/16/05 trip.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/29/2005	37.6	95.56	95.53	-0.03	IFG4
2nd	7/16/2005		95.33			
3rd	8/9/2005	5.5	94.77	94.75	-0.02	IFG4
4th	7/6/2006	22.9	95.25	95.30	0.05	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.05ft is within acceptable range.
(c) No discharge was measured during the 7/16/05 site visit.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 5.5cfs, 22.9cfs, and 37.6cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/29/2005	37.6	Y
7/16/2005		
8/9/2005	5.5	Y
7/6/2006	22.9	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary in normal trends.

IFG4 Data Deck

Stream: South Fork Koktuli River

Reach: SFK-C

Site/TR: 05-SFK3-PL1

Habitat Type: Pool

River Kilometer: 39.83

Stream: South Fork Koktuli River
Reach: C
Site Name: 05-SFK3-PL1
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/14/2005	1	100.00	99.22	100.61
2nd	7/16/2005	2	100.00	99.20	100.59
3rd	8/10/2005	3	100.00	99.19	100.60
4th	7/8/2006	4	100.00	99.25	100.65

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Level loop of 2006 showed BM may have moved up slightly about 0.03ft to 0.04ft from the the control pins set up initially in 2005.
(c) As the result, HI of 2006 is artificially lowered by 0.04ft so that all surveys in both years would be referenced to the same 2005 datum.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/14/2005	95.85
7/16/2005	94.93
8/10/2005	94.07
7/8/2006	95.27

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/14/2005	70.5
7/16/2005	
8/10/2005	8.2
7/8/2006	31.6

Substrate was surveyed on 7/16/05, but no discharge was measured on the same day.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/14/2005	0.034%	87.5
7/16/2005	0.046%	64.8
8/10/2005	-0.020%	100.6
7/8/2006	0.027%	75

Negative slope could be due to surveying/recording errors.
Velocity head was less than 0.01ft, too small to result in the negative slope.
The slope S=0.034% of 6/14/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/14/2005	92.35
7/16/2005	
8/10/2005	92.27
7/8/2006	92.27
Invert	92.35
SZF	92.35

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in the 7/16/05 trip.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/14/2005	70.5	95.85	95.99	0.14	IFG4
2nd	7/16/2005		94.93			
3rd	8/10/2005	8.2	94.07	94.09	0.02	IFG4
4th	7/8/2006	31.6	95.27	95.12	-0.15	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.15ft is marginally acceptable for a pool habitat.
This transect is a pool with deep water depth and a single substrate type of fine. As the result, a calibration error of 0.15 is not expected to have significant impact on the habitat area.
(c) No discharge was measured during the 7/16/05 trip

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 8.2cfs, 31.6cfs and 70.5cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/14/2005	70.5	Y
7/16/2005		
8/10/2005	8.2	Y
7/8/2006	31.6	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and varied with normal trends.

Stream: South Fork Koktuli River

Reach: SFK-C

Site/TR: 05-SFK3-PL2

Habitat Type: Pool

River Kilometer: 40.93

Stream: South Fork Koktuli River
Reach: C
Site Name: 05-SFK3-PL2
Habitat Type: Run

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	Trip	BM	HP	TP
1st	6/14/2005	1	100.00	99.23	99.57
2nd	7/16/2005	2	100.00	99.21	99.56
3rd	8/10/2005	3	100.00	99.20	99.55
4th	7/8/2006	4	100.00	99.29	99.56

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and TP were within 0.02ft during the 2005-2006 period, suggesting the BM and TP were stable in this period.
(c) HP elevation in 2006 rose 0.06ft from the initial 2005 datum. No corrections were needed for WSEs because the survey datum was based on BM.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/14/2005	94.66
7/16/2005	93.98
8/10/2005	93.11
7/8/2006	93.91

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/14/2005	63.6
7/16/2005	
8/10/2005	9.5
7/8/2006	33.4

Substrate was surveyed on 7/16/05, but no discharge was measured on the same day.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/14/2005	0.058%	136.8
7/16/2005	0.059%	136.5
8/10/2005	0.149%	121
7/8/2006	0.067%	134.2

The slope S=0.058% of 6/14/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/14/2005	92.06
7/16/2005	
8/10/2005	92.01
7/8/2006	92.01
Invert	92.06
SZF	92.06

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed in the 7/16/05 trip.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR	calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/14/2005	63.6	94.66	94.63	-0.03	IFG4
2nd	7/16/2005		93.98			
3rd	8/10/2005	9.5	93.11	93.10	-0.01	IFG4
4th	7/8/2006	33.4	93.91	93.95	0.04	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharge was measured in the 7/16/05 trip

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 9.5cfs, 33.4cfs and 63.6cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/14/2005	63.6	Y
7/16/2005		
8/10/2005	9.5	Y
7/8/2006	33.4	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and generally varied with normal trends except at low flows where Q<25cfs.

Date	BM1	BM2	BM3	BM4	1-LHP	2-RHP	3-RHP	4-RHP	5-RHP	6-LHP
6/19/2008	100.00	99.83	93.01	92.39	92.17	91.56	91.88	90.78	92.32	92.38
7/25/2008	100.00	99.83	93.00	92.39	92.19	91.59	91.90	90.79	92.32	92.40
8/7/2008	100.00	99.83	92.99	92.38		91.56	91.87			
8/22/2008	100.00	99.83	92.98	92.39						

(a) Elevations of control pins (BM, left HP [LHP], right HP [RHP]) are taken from the first half of each level loop survey
(b) Relative elevation changes between the control pins were within 0.01ft.
(c) The small elevation changes indicated control pins were stable during the survey period.

Measured WSE:

There were two WSEs (Right and Left) measured on each channel/transect for each flow,
and the average of the two was used as representative WSE for modeling.

Date	Measured WSE (ft)						
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	
						LC	RC
6/19/2008	89.57	89.77	89.83	89.96	90.02	90.23	90.10
7/25/2008	89.01	89.19	89.23	89.30	89.36	89.58	89.51
8/7/2008	88.66	88.77	88.80	88.92	89.00	89.19	89.05
8/22/2008		88.62	88.62	88.75	88.84	89.05	89.01

WSEs of RC and LC are not the same for the Island Complex transect (i.e., TR-6), but the WSE of the left channels was used for hydraulic calibration, because most of the water flows through the left channels.
The bed bathymetry of RCs is adjusted, with the amount of the WSE difference between RC and LC, so that both channels (RC and LC) would have the same WSE, as required by the IFG4 model.

calibration notes

Discharge:

All measured discharges are listed in the following table.

	Measured Discharge (cfs)						
Date	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	Ave
6/19/2008	91.0					99.7	95.3
7/25/2008	37.9	39.9	36.9	42.6	40.0	37.6	39.1
8/7/2008	15.6					13.5	14.5
8/22/2008		7.7	6.6	8.4	8.1		7.7

Average Q of all transects is used as the representative flows of the site for hydraulic calibration.

Longitudinal WSE Slope:

Slopes are calculated using the measured WSEs and longitudinal distances.

Distances are the measured length between the headpins of two adjacent transects.

Longitudinal Stations						
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
LB	0.0	59.0	77.0	74.0	28.5	81.5
RB	0.0	47.0	35.0	53.0	40.0	70.0
Ave	0.0	53.0	56.0	63.5	34.3	75.8
Station	0.0	53.0	109.0	172.5	206.8	282.5
Slope						
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/19/2008		0.39%	0.24%	0.23%	0.22%	0.235%
7/25/2008		0.34%	0.21%	0.17%	0.17%	0.20%
8/7/2008		0.20%	0.13%	0.15%	0.16%	0.19%
8/22/2008			0.00%	0.11%	0.14%	0.19%

Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.

The TR-6 slope S=0.235% of 6/19/2008 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Discharge (cfs)					
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/19/2008	87.97					87.88
7/25/2008	87.96	87.04	87.73	88.00	87.06	87.88
8/7/2008	87.86					87.89
8/22/2008		87.02	87.67	88.00	87.14	
Invert	87.97	87.04	87.73	88.00	87.14	87.89
SZF	87.97	87.97	87.97	88.20	88.34	88.49

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
SZF of the upstream transect must be no less than that of its downstream transect.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

IFG4 model was applied to all 6 transects for WSE calibration.

WSE Calibration Results:

Survey Date	Q (cfs)	Measured WSE(ft)						Calibrated WSE(ft)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6

8/22/2008	7.7		88.62	88.62	88.75	88.84	89.05		88.60	88.61	88.74	88.82	89.02

Survey Date	Q (cfs)	WSE calibration error (ft)						WSE Calibration Method					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/19/2008	95.3	-0.02	-0.03	-0.02	-0.04	-0.04	-0.04	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4
7/25/2008	39.1	0.03	0.02	0.01	0.04	0.04	0.04	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4
8/7/2008	14.5	-0.01	0.03	0.01	0.00	0.00	0.02	IFG4	IFG4	IFG4	IFG4	IFG4	IFG4
8/22/2008	7.7		-0.02	-0.01	-0.01	-0.02	-0.03		IFG4	IFG4	IFG4	IFG4	IFG4

(a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration 0.04ft is within the acceptable range.

calibration notes

(3) Velocity calibration

This site has six transects and each transect has 2 or 3 velocity/discharge measurements.
TR-1 and TR-6 each has three times of velocity measurements and TR-2, TR-3, TR-4, and TR-5 each has only two.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by the IFG4 model. Then the calibrated velocity profile was used to simulate the velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/19/2008	95.3	Y					Y
7/25/2008	39.1	Y	Y	Y	Y	Y	Y
8/7/2008	14.5	Y					Y
8/22/2008	7.7		Y	Y	Y	Y	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges with normal varying trends, except TR-1. The Manning's n and Froude number of TR-1 increases and decreases, respectively, with increasing flows with the measured flow range between 7.7cfs and 95.3cfs. Outside the measured flow range, the Manning's n values and Fr numbers both appear varying in normal trends.

There are minor kinks in the plots of Fr and Manning's n values for TR-4, TR-5, and TR-6. Examination of hydraulics and cross-sectional profiles indicates the kinks are caused by the small plateaus in the middle (TR-6) or on the right side (TR-4 & TR-5) of the channel.

(1) Field Data

Level Loop and Headpin Elevations:

Date	BM1	BM2	BM3	4-RHP	5-RHP
6/24/2008	100.00	100.37		100.00	101.08
7/23/2008	100.00	100.36	101.38		
8/18/2008	100.00	100.37	101.39		101.09

(a) Elevations of control pins (BM, right HP [RHP], left HP [LHP]) are taken from the first half of each level loop survey
(b) Relative elevation changes among the control pins were 0.01ft.
(c) The small relative elevation changes indicated control pins were stable during the survey period.

Measured WSE:

There were two WSEs (Right and Left) measured on each transect for each flow,
and the average of the two was used as representative WSE for modeling.
High flow survey on 6/24/08 has only one WSE measured on the right side of the stream.

	Measured WSE(ft)				
Date	TR-1	TR-2	TR-3	TR-4	TR-5
6/24/2008	96.33	97.25	97.57	97.71	97.98
7/23/2008	96.15	97.10	97.33	97.63	97.89
8/18/2008	95.65	96.61	97.06	97.28	97.49

TR-1 WSE of 6/24/08 survey is estimated.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Measured Discharge (cfs)					
	TR-1	TR-2	TR-3	TR-4	TR-5	**Ave Q**
6/24/2008						**380**
7/23/2008		312.8	330.4	321.8	334.8	**325.0**
8/18/2008	201.6	205.8	201.8	188.1	211.3	**201.7**

Average Q of all transect was used as the representative flow for the site

Flow of June 24, 2008 was estimated using the gaged flows received from Knight Piesold:

There was no measured flow for the June (6/24/08) trip due to safety concern of fast current and deep flow. The flow discharge can be estimated using the daily flow measured/calculated at the three gaging stations set up by Knight Piesold on the APC land.

	APC1	APC2	APC3	
River Kilometer (RK)	14.359	9.846	2.240	(approximate values from S.Beck)
daily Flow (cfs) on 6/24/08	313.7	282.8	418.3	(daily flow from Knight Piesold)

APC1 is the most upstream station of the three gages, and APC3 is the most downstream one. APC2 is approximately in the middle of the three. APC2, however, has lower flow than APC3, and that may be due to the groundwater down-welling and/or distributions to side channels. The real cause of lower flow at APC2, however, is not in the scope of this discussion.

The PHABSIM site 08-UTC1-MS1 is located roughly in the middle of APC2 and APC3, and there is a tributary entering the Upper Talarik just below APC2. Without the tributary contribution, the flow at the site can be estimated using the flows of APC2 and APC3 with equal weighting of each. Due to the contribution of the tributary, the flow at the PHABSIM site is estimated with 3/4 weighting for the APC3 and 1/4 weighting for the APC2.
As the result, the Q at the PHABSIM site = 282.8*1/4+418.3*3/4=384.4 or approximately Q=380cfs.

calibration notes

Longitudinal WSE Slope:

Slopes are calculated using the measured WSEs and longitudinal distances.
Distances were originally estimated using the GPS coordinates in 7/09, but later in 12/09 were updated after TR locations were QA/QC'd with the field map and distance calculation was based on the channel center line.

Longitudinal TR Stations						
TR	TR-1	TR-2	TR-3	TR-4	TR-5	
LB	0.0					
RB	0.0					
GPS	0.0	183.8	263.8	365.8	437.8	<-- based on GPS coordinates of the TR control pins
Station	0.0	183.8	250.8	334.6	413.0	<-- based on GPS, channel centerline, and QA/QC'd TR locations.

Longitudinal WSE Slope						
TR	TR-1	TR-2	TR-3	TR-4	TR-5	
6/24/2008	-	0.500%	0.494%	0.412%	0.400%	<-- TR-1 WSE is an estimated, corrected value
7/23/2008	-	0.514%	0.471%	0.442%	0.420%	<-- use this slope in calibration
8/18/2008	-	0.522%	0.564%	0.489%	0.447%	

Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.
The TR-5 slope S=0.420% of 7/23/2008 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Discharge (cfs)				
	TR-1	TR-2	TR-3	TR-4	TR-5
6/24/2008					
7/23/2008		94.00	95.23	94.23	94.69
8/18/2008	91.65	94.01	95.01	94.18	94.79
Invert	91.65	94.01	95.23	94.23	94.79
SZF	91.65	94.01	95.73	95.73	95.73

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
SZF of the upstream transect must be no less than that of its downstream transect.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

IFG4 was applied to calibrating WE of TR-1.

Three WSE calibration methods were tried that include IFG4, WSP, and HEC-RAS
WSP and HEC-RAS resulted in similar results that the simulated WSEs of TR-3 and TR-4 started to approach each other at flows higher than 500cfs. The first thought was that the simulation was erroneous, but a closer look at both transect profiles revealed that this was possible because TR-4 was a narrower (than TR-3) channel where water would accelerate and result in a lower WSE at higher flows when the water velocity was fast.

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.05ft is within the acceptable range.

(3) Velocity calibration

This site has five transects and each transect has 2 velocity/discharge measurements except TR-1 which has only one. Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. Due to only one measured velocity profile available for TR-1, the calibrated velocity template was used to predict velocities for the entire simulation range of flows.
The adjustment of n values was made at the stations where simulated velocities were significantly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)				
		TR-1	TR-2	TR-3	TR-4	TR-5
6/24/2008	380.0					
7/23/2008	325.0		Y	Y	Y	Y
8/18/2008	201.7	Y	Y	Y	Y	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges with normal trends.
The Manning's n values of TR-3 stay virtually flat within the entire range of simulation flows. This is considered ok given the abrupt expansion of channel width and flow conveyance area from TR-4 (u/s) to TR-3 (d/s) when flows are high.

* RK is an abbreviation for River Kilometer

Stream: Upper Talarik Creek

Reach: UT-C

Site/TR: 05-UTC1-IC1

Habitat Type: Island Complex

River Kilometer: 16.84

Stream: **Upper Talarik Creek**
Reach: **C**
Site Name: **05-UTC1-IC1**
Habitat Type: **Island Complex**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	6/19/2005	100.00	99.41	99.48
2nd	7/20/2005	100.00	99.42	99.49
3rd	7/26/2006	100.00	99.46	99.38
4th	4/7/2007	100.00	99.43	99.54

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between control pins indicated the pins were slightly moved in 2006 and 2007. The disturbance was +0.05ft for HP and -0.10ft for TP, both from 2005 to 2006.
(c) The disturbance cause was unclear. We are unable to determine how much each pin was moved from the survey results, to adjust all WSEs to the datum initially set up in 2005.
(d) It is decided, however, no adjustment would be made to any WSEs because we consider the 0.05ft change between BM and HP is still marginally acceptable. The errors resulted from the unadjusted WSEs should not be too significant.
(e) Photos of 4/7/07 survey showed thick ice covered the entire channel. Hydraulics were impacted by ice and were not used for modeling.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

	WSE (ft)	
Date	Left	Right (main)
6/19/2005	96.31	96.46
7/20/2005	96.12	96.27
7/26/2006	96.16	96.30
4/7/2007	98.42	98.51

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Q (cfs)		
	Left	Right (main)	Total
6/19/2005	2.6	268.6	271.2
7/20/2005			
7/26/2006	0.3	86.4	86.8
4/7/2007			

No discharge was measured during the 7/20/05 survey.
Discharge measured on 4/7/07 was affected by ice. Photos showed thick ice in channel.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/19/2005	0.813%	75
7/20/2005	0.813%	75
7/26/2006	0.649%	72.4
4/7/2007	NA	NA

No longitudinal WSE was measured in 4/7/07 trip.
The slope S=0.813% of 6/19/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert	
	Right (Main) Channel	Left (Side) Channel
6/19/2005	94.86	95.91
7/20/2005		
7/26/2006	94.90	95.96
4/7/2007	96.72	97.42
max Invert	94.90	
SZF	96.15	

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed during the 7/20/05 site visit.
(4) Transect profile of 4/7/07 was affected by ice. The invert was not used to determine SZF.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE -R ch. (ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR1	TR1	TR1	
1st	6/19/2005	271.2	96.46	96.46	0.00	IFG4
2nd	7/20/2005		96.27			
3rd	7/26/2006	86.8	96.30	96.30	0.00	IFG4
4th	4/7/2007		98.51			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No discharge was measured in the 7/20/05 trip.
(d) Field photos of 4/7/07 showed thick ice on banks and in the channel. Hydraulics were impacted by ice and were not used in modeling.
(e) This transect has only two pairs of WSE~Q available, but Log-log (IFG4 method) relationship was still assumed when calibrating the WSE~Q rating curve. Usually MANSQ would be applied for the calibration when only two pairs of WSE~Q can be used, but MANSQ calibration results showed large (>0.25ft) calibration errors. To make rating curve more reasonable, IFG4's log-log relationship was applied.

calibration notes

(3) Velocity calibration

This site has one transect with two complete velocity/discharge measurements, including 86.8cfs and 271.2cfs. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the two calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/19/2005	271.2	Y
7/20/2005		
7/26/2006	86.8	Y
4/7/2007		

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

IFG4 Data Deck

Stream: Upper Talarik Creek

Reach: UT-C

Site/TR: 05-UTC1-RF2

Habitat Type: Riffle

River Kilometer: 17.36

Stream: Upper Talarik Creek
Reach: C
Site Name: 05-UTC1-RF2
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	AP	TP
1st	6/20/2005	1	100.00	98.83	99.49	101.25
2nd	7/19/2005	2	100.00	98.81	99.49	101.24
3rd	8/18/2005	3	100.00	98.82	98.49	101.24
4th	7/25/2006	4	100.00	98.82	99.51	101.21
5th	4/7/2007	5	100.00	98.87	99.61	101.13

(a) Elevations of control pins (BM, HP, AP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes among BM, HP and AP were within ±0.01ft in 2005-2006 period. Small changes suggested the three pins be stable in that period.
(c) TP moved slightly 0.04ft in 2006. No WSE corrections were needed because the elevation datum was based on BM, which was stable.
(d) Field notes of 4/7/07 indicated ice at the site. Also the transect profile plot showed the bed was elevated, likely by the anchor ice in the channel. The hydraulics were impacted by the ice and thus were not included for modeling.

calibration notes

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.
Off channel is considered a side channel in the modeling.

Date	Main Channel	Off Channel
6/20/2005	95.90	94.89
7/19/2005	95.68	94.87
8/18/2005	95.65	94.78
7/25/2006	95.70	94.97
4/7/2007	97.61	97.04

No flow was measured on 7/19/05.
The WSE of 4/7/07 was affected by ice.

Discharge:

All measured discharges are listed in the following table.

Date	Main Channel	Off Channel	Total	
6/20/2005	255.6	1.80	257.4	
7/19/2005				Substrate survey
8/18/2005	200.2	1.24	201.5	
7/25/2006	213.8	-0.15	213.7	
4/7/2007	113.2	6.67	119.9	ice

No flow was measured on 7/19/05.
Channel was occupied by ice in 4/7/07 trip.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/20/2005	0.849%	139.0
7/19/2005	0.820%	139.0
8/18/2005	0.899%	139.0
7/25/2006	0.946%	120.5
4/7/2007	0.439%	139.0

The slope S=0.849% of 6/20/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/20/2005	94.10
7/19/2005	
8/18/2005	94.15
7/25/2006	94.20
4/7/2007	95.91
max Invert	94.20
SZF	94.20

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed during the 7/19/05 site visit.
(4) Transect profile of 4/7/07 was affected by ice. The invert was not used to determine SZF.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

IFG4 was first tried for WSE modeling. Small calibration errors were resulted in, but the simulated hydraulics were unable to be justified. Therefore MANSQ was used and reasonable simulated hydraulics were obtained. β=0.00 was used in MANSQ WSE calibration.

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR1	TR1	TR1	
1st	6/20/2005	257.4	95.90	95.90	0.00	MANSQ
2nd	7/19/2005		95.68			
3rd	8/18/2005	201.5	95.65	95.69	0.04	MANSQ
4th	7/25/2006	213.7	95.70	95.73	0.03	MANSQ
5th	4/7/2007	119.9	97.61			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.
(c) No discharge was measured in 7/19/05 trip.
(d) No field photos were available for 4/7/07 site visit, but the field notes indicated ice at the site and transect profile surveyed on this date showed the bed was elevated significantly. As the result, hydraulics were severely affected by ice and were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 201.5cfs, 213.7cfs, and 257.4cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/20/2005	257.4	Y
7/19/2005		
8/18/2005	201.5	Y
7/25/2006	213.7	
4/7/2007	119.9	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Stream: Upper Talarik Creek

Reach: UT-C

Site/TR: 05-UTC1-RN1

Habitat Type: Run

River Kilometer: 19.34

Stream : **Upper Talarik Creek**
Reach: **C**
Site Name: **05-UTC1-RN1**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/17/2005	1	100.00	100.32	98.87
2nd	7/19/2005	2	100.00	100.33	98.87
3rd	8/17/2005	3	100.00	100.31	98.86
4th	7/25/2006	4	100.00	100.33	98.86
5th	4/8/2007	5	100.00	100.25	98.75

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between any two control pins were within±0.01ft in 2005-2006 period. Small changes indicated the control pins were stable in that period.
(c) TP moved about 0.1ft in 2007. No WSE corrections were needed because the survey elevation datum was based on BM, which was stable, and hydraulics of 2007 were not used in modeling due to sever ice impact.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/17/2005	96.39
7/19/2005	96.32
8/17/2005	96.25
7/25/2006	96.39
4/8/2007	97.27

No flow was measured on 7/19/05.
Channel was occupied by ice during the 4/7/07 survey. Hydraulics had been impacted by ice

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/17/2005	195.2
7/19/2005	
8/17/2005	143.6
7/25/2006	194.8
4/8/2007	173.6

No flow was measured on 7/19/05.
Trip photos of 4/8/07 showed floating ice in the channel and water frozen near shore
The measured flow of 4/8/07 may not be accurate.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/17/2005	0.066%	195.7
7/19/2005	0.067%	195.0
8/17/2005	0.022%	138.0
7/25/2006	0.072%	152.1
4/8/2007	0.286%	182.0

The slope S=0.066% of 6/17/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/17/2005	93.59
7/19/2005	
8/17/2005	93.55
7/25/2006	93.29
4/8/2007	93.97
max Invert	93.59
SZF	95.89

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed during the 7/19/05 site visit.
(4) Transect profile of 4/8/07 was affected by ice. The invert was not used to determine SZF.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR1	TR1	TR1	
1st	6/17/2005	195.2	96.39	96.39	0.00	IFG4
2nd	7/19/2005		96.32			
3rd	8/17/2005	143.6	96.25	96.25	0.00	IFG4
4th	7/25/2006	194.8	96.39	96.39	0.00	
5th	4/8/2007	173.6	97.27			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No discharge was measured in 7/19/05 trip.
(d) Photos of 4/7/07 site visit showed thick ice on waters edge and floating ice in the channel. Hydraulics were impacted by ice and were not used in the modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 143.6cfs, 194.8cfs, and 195.2cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/17/2005	195.2	Y
7/19/2005		
8/17/2005	143.6	Y
7/25/2006	194.8	
4/8/2007	173.6	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.
A little kink in Manning's n and Froude number plots at Q>420cfs was due to the small plateau on the left bank above El= 97ft.

Stream: Upper Talarik Creek

Reach: UT-C

Site/TR: 04-UTC-IC2

Habitat Type: Island Complex

River Kilometer: 19.82

Stream: **Upper Talarik Creek**
Reach: **C**
Site Name: **04-UTC-IC2**
Habitat Type: **Island Complex**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/19/2005	100.00	99.17	101.35
2nd	8/17/2005	100.00	99.18	101.34
3rd	7/3/2006	100.00	99.21	101.35
4th	7/25/2006	100.00	99.19	101.36
5th	4/7/2007	100.00	99.33	101.49

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and TP were within ±0.01ft from 2005 to 2006. Small changes suggested BM be stable during the period.
(c) HP elevation changed as much as 0.04ft from 2005 to 2006, but this won't affect WSE results because the surveys were based on the BM datum, which was considered stable.
(d) Greater pin elevation changes occurred in 2007. Photos of 4/7/07 survey showed water was covered in thick ice, and as the results, the surveyed data were not included for modeling.

calibration notes

Measured WSE:

This transect is an island complex with a right (side) channel and a left (main) channel.
There were three WSEs (Right, mid, and Left) measured across each channel for each flow,
and the average of the three was used as representative WSE of each channel for modeling.

	WSE (ft)	
Date	Left (main)	Right (side)
7/19/2005	95.92	95.65
8/17/2005	95.77	95.59
7/3/2006	95.96	95.76
7/25/2006	95.82	95.64
4/7/2007	96.53	95.86

WSE's of the left channel were used for modeling, because left channel carried the majority of water.
Bed elevation of the right channel is adjusted based on the difference between the two WSEs.

Dischar

All measured discharges are listed in the following table.

	Q (cfs)		
Date	Left (main)	Right (side)	Total
7/19/2005			
8/17/2005	125.99	39.2	165.22
7/3/2006			
7/25/2006	130.5	50.9	181.4
4/7/2007	113.4	47.6	161.06

(1) No discharges were measured in the 7/19/05 and 7/3/06 trips.
(2) The hydraulics of 4/7/07 trip was severely affected by thick ice and not used for modeling.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (ft/ft)	
	Left (main)	Right (side)
7/19/2005	0.835%	0.43%
8/17/2005	1.066%	0.53%
7/3/2006	0.986%	0.57%
7/25/2006	0.943%	0.77%
4/7/2007	1.019%	NA

The slope S=0.835% of 7/19/2005 survey was used for hydraulic modeling.

Date	WSE Slope Distance (ft)	
	Left (main)	Right (side)
7/19/2005	87.4	66.7
8/17/2005	175.5	60.5
7/3/2006	141.0	67.0
7/25/2006	105.0	52.0
4/7/2007	258.0	NA

No WSE slope was surveyed for the right channel during the 4/7/07 trip.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)	
	Left (main)	Right (side)
7/19/2005	94.67	94.41
8/17/2005	94.57	94.39
7/3/2006	94.16	94.56
7/25/2006	94.02	94.34
4/7/2007	95.23	94.56
Invert	94.57	
SZF	93.26	

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) The inverts of 7/17/05 and 7/3/06 were not used for determining SZF due to no flows measured.
(4) The invert of 4/7/07 was not used for determining SZF due to ice in the channel.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	7/19/2005		95.92			
2nd	8/17/2005	165.2	95.77	95.77	0.00	MANSQ
3rd	7/3/2006		95.96			
4th	7/25/2006	181.4	95.82	95.82	0.00	MANSQ
5th	4/7/2007	161.1	96.53			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No discharges were measured during the 7/19/05 and 7/3/06 site visits.
(d) Photos of 4/7/07 site visit showed the channel was covered in thick ice.
Hydraulics were affected by ice and not used in modeling.
(e) MANSQ was used for calibration because this transect has only two pairs of WSE~Q.
Coefficient β=-0.1 was used, and the results are listed as follows.

calibration notes

calibration notes

(3) Velocity calibration

This site has one transect with two complete velocity/discharge measurements, including 165.2cfs and 181.4cfs. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the two calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/19/2005		
8/17/2005	165.2	Y
7/3/2006		
7/25/2006	181.4	Y
4/7/2007	161.1	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary in normal trends.

Stream: Upper Talarik Creek

Reach: UT-C

Site/TR: 04-UTC-RN1

Habitat Type: Run

River Kilometer: 23.75

Stream: Upper Talarik Creek
Reach: C
Site Name: 04-UTC-RN1
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1	7/19/2005	100.00	98.76	99.30
2	8/16/2005	100.00	98.77	99.30
3	7/3/2006	100.00	98.80	99.32
4	7/25/2006	100.00	98.77	99.30
5	4/8/2007	100.00		99.42

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and TP were within 0.02ft during 2005- 2006 period. Small changes indicated both pins were stable during the period.
(c) Photos of 4/8/07 site visit showed thick ice on waters edge and ice fallen in water, both of which suggested the hydraulics be impacted and not be used for modeling.
(d) HP was lost in the 2007 survey. TP elevation increased by 0.12ft in 2007, but not able to determine if BM or TP or both were moved from the survey results.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/19/2005	97.92
8/16/2005	97.69
7/3/2006	97.82
7/25/2006	97.83
4/8/2007	97.68

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/19/2005	
8/16/2005	124.1
7/3/2006	
7/25/2006	191.1
4/8/2007	165.4

Flow measurement of 4/8/07 site visit may be incomplete due to thick ice on waters edge.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/19/2005	0.233%	158.5
8/16/2005	0.253%	193.7
7/3/2006	0.455%	132.0
7/25/2006	0.430%	118.5
4/8/2007	0.390%	84.7

The slope S=0.253% of 8/16/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/19/2005	96.29
8/16/2005	96.19
7/3/2006	96.26
7/25/2006	96.23
4/8/2007	96.08
Invert	96.23
SZF	96.23

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) The inverts of 7/19/05 and 7/3/06 were not used for determining SZF due to no flows measured.
(4) The invert of 4/8/07 was not used for determining SZF due to ice impact.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR1	calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1	7/19/2005		97.92			
2	8/16/2005	124.1	97.69	97.69	0.00	MANSQ
3	7/3/2006		97.82			
4	7/25/2006	191.1	97.83	97.82	-0.01	MANSQ
5	4/8/2007	165.4	97.68			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No discharges were measured during the 7/19/05 and 7/3/06 site visits.
(d) Hydraulics of 4/8/07 site visit did not have complete flow measuredment due to shore ice and thus were not used for modeling.
(e) MANSQ was used for calibration because this transect has ony two pairs of WSE~Q. Coefficient β=-1.7 was used, and the results are listed as follows.

calibration notes

Simulation Q (cfs)	WSE (ft)
50	97.44
60	97.49
70	97.53

420	98.14
440	98.16
460	98.18
480	98.20

calibration notes

(3) Velocity calibration

This site has one transect with two complete velocity/discharge measurements, including 124.1cfs and and 191.1cfs. Both measured velocity profiles were used as template for velocity calibration. Simulated velocity profiles of both measured flows were calibrated to resemble their measured profiles by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then each calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the water's edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/19/2005		
8/16/2005	124.1	Y
7/3/2006		
7/25/2006	191.1	Y
4/8/2007	165.4	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) appeared to vary with normal trends.
Froude number appeared to be large and close to critical flow, and Manning's n values of higher simulation flows are less than 0.02, which is relatively small for a gravel channel. Additional surveys are needed to more accurately address the range of Froude number and channel roughness.

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1	7/19/2005	100.00	99.58	98.70
2	8/16/2005	100.00	99.56	98.70
3	9/7/2005	100.00	99.56	98.71
4	7/24/2006	100.00	99.57	98.70
5	4/6/2007	100.00	99.61	98.69

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and TP were within ±0.01ft in 2005-2007 period. Small changes indicated survey datum was stable during that period.
(c) HP elevation had a 0.03ft shift in 2007. This change did not affect WSEs because the survey datum was based on BM which was stable suring the entire course of survey period.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/19/2005	95.00
8/16/2005	94.85
9/7/2005	95.64
7/24/2006	94.99
4/6/2007	94.77

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/19/2005	
8/16/2005	142.1
9/7/2005	419.9
7/24/2006	159.5
4/6/2007	121.4

Discharge was not measured during the 7/19/05 site visit.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/19/2005	0.299%	66.8
8/16/2005	0.180%	206.0
9/7/2005	0.310%	177.4
7/24/2006	0.190%	115.9
4/6/2007	0.439%	378.0

The slope S=0.180% of 8/16/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/19/2005	93.05
8/16/2005	93.05
9/7/2005	93.14
7/24/2006	93.19
4/6/2007	93.17
Invert	93.19
SZF	93.19

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) The invert of 7/19/05 surevy was not used for determining SZF due to no flow measured.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1	7/19/2005		95.00			
2	8/16/2005	142.1	94.85	94.87	0.02	IFG4
3	9/7/2005	419.9	95.64	95.66	0.02	IFG4
4	7/24/2006	159.5	94.99	94.94	-0.05	IFG4
5	4/6/2007	121.4	94.77	94.78	0.01	IFG4

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.05ft is within acceptable range.
(c) No discharge was measured in 7/19/05 trip.
(d) Field notes of 4/6/07 indicated ice on the shore, but there were no site photos available to show the extend of ice impact on hydraulics. Photos taken at a nearby site, 04-UTC-RN1, on 4/8/07 showed the bank was covered in ice but channel was almost clear of ice. It is thus assumed the ice impact on the hydraulics was minimal, and the surveyed data were included in hydraulic modeling.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 121.4cfs, 142.1cfs, 159.5cfs, and 419.9cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/19/2005		
8/16/2005	142.1	Y
9/7/2005	419.9	Y
7/24/2006	159.5	Y
4/6/2007	121.4	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends for Q ≤ 500cfs.
For flows greater than 500cfs, the trends were virtually flat for both Froude number and Manning's n values.
The flat trends may caused by the small flood plain between Sta=35 and Sta=65ft, which increased wetted perimeter significantly while flow conveyance area only increased moderately when flow just inundated floodplain.

Site Name: 04-UTC-RF2
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/20/2005	99.79	101.17	101.20
2nd	8/16/2005	99.79	101.19	101.17
3rd	9/7/2005	99.79	101.17	101.20
4th	7/24/2006		101.17	101.21
5th	4/6/2007		101.17	101.26

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between the control pins were within 0.02ft during the 2005-2006 period. Small changes indicated control pins were stable during that period.
(c) BM was lost in the 2006 survey, but consistent relative elevation between HP and TP suggested survey datum be stable.
(d) TP elevation increased by 0.05ft from 2006 to 2007. Not able to determine if HP or TP or both were moved. No photos for the 2007 survey, but comparison of the 2007 transect profile to the previous ones indicated the channel was affected by anchor ice. As the result, surveyed hydraulics were not used for modeling.

calibration notes

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/20/2005	99.51
8/16/2005	99.42
9/7/2005	100.05
7/24/2006	99.51
4/6/2007	99.51

WSEs of 4/6/07 survey was affected by ice. No photos available, but the field notes indicated there was shore ice as thick as 2ft.

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/20/2005	
8/16/2005	151.1
9/7/2005	402.7
7/24/2006	166.5
4/6/2007	120.8

No discharge was measured on 7/20/05.
The discharge measurement of 4/6/07 was incomplete.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/20/2005	0.559%	153.4
8/16/2005	0.572%	337.5
9/7/2005	0.634%	227.3
7/24/2006	0.644%	139.7
4/6/2007	0.717%	337.5

The slope S=0.572% of 8/16/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/20/2005	97.89
8/16/2005	97.82
9/7/2005	97.75
7/24/2006	97.71
4/6/2007	97.81
Invert	97.89
SZF	97.89

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) The invert of 4/6/07 was not used for determining SZF due to thick shore ice.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	measured WSE(ft) TR1	calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	7/20/2005		99.51			
2nd	8/16/2005	151.1	99.42	99.44	0.02	IFG4
3rd	9/7/2005	402.7	100.05	100.06	0.01	IFG4
4th	7/24/2006	166.5	99.51	99.49	-0.02	IFG4
5th	4/6/2007	120.8	99.51			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range.
(c) No discharge was measured during the 7/20/05 site visit.
(d) No photos of 4/6/07 site visit were available, but the field notes indicated there was thick shore ice.
Hydraulics were affected by ice and not used in modeling.
Flow measurement was incomplete.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 151.1cfs, 166.5cfs, and 402.7cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/20/2005		
8/16/2005	151.1	Y
9/7/2005	402.7	Y
7/24/2006	166.5	
4/6/2007	120.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

* RK is an abbreviation for River Kilometer

Stream: Upper Talarik Creek

Reach: UT-D

Site/TR: 07-UTC2-RN3

Habitat Type: Run

River Kilometer: 26.02

Stream: **Upper Talarik Creek**
Reach: **D**
Site Name: **07-UTC2-RN3**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/2/2007	1	100.00	101.64	98.76
2nd	7/17/2007	2	100.00	101.67	98.75
3rd	10/19/2007	3	100.00	101.75	98.82

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes showed the pins moved slightly in the 7/07 survey from their initial setup in 6/07.
(c) The pins moved more in the 10/07 survey. The relative elevation changes showed HP and TP were elevated by 0.11ft and 0.06ft, respectively, from the initial setup.
(d) From the relative elevation changes, it was decided the BM sank 0.1ft in 10/07. Therefore, correction was made to the HI for the WSE in the October survey.
(e) No correction for the HI of 7/07 WSE survey was needed because datum shift was small.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/2/2007	96.13
7/17/2007	95.98
10/19/2007	96.41

The October WSE has reflected the 0.10ft datum correction.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/2/2007	136.8
7/17/2007	96.7
10/19/2007	190.5

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/2/2007	0.248%	161.2
7/17/2007	0.142%	105.5
10/19/2007	0.329%	170

The slope S=0.248% of 6/2/2007 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/2/2007	94.33
7/17/2007	94.43
10/19/2007	94.21
max Invert	94.43
SZF	94.43

(1) Transect invert is the lowest elevation of the cross-section

(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method	WUA (Y/N)
1st	6/2/2007	136.8	96.13	96.17	0.04	IFG4	Y
2nd	7/17/2007	96.7	95.98	95.96	-0.02	IFG4	Y
3rd	10/19/2007	190.5	96.41	96.39	-0.02	IFG4	Y

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range.

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 96.7cfs, 136.8cfs, and 190.5cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/2/2007	136.8	Y
7/17/2007	96.7	Y
10/19/2007	190.5	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

IFG4 Data Deck

Stream: Upper Talarik Creek

Reach: UT-D

Site/TR: 07-UTC2-RN1

Habitat Type: Run

River Kilometer: 29.31

Stream: **Upper Talarik Creek**
Reach: **D**
Site Name: **07-UTC2-RN1**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/1/2007	1	100.00	98.46	99.96
2nd	7/18/2007	2	100.00	98.49	99.99
3rd	10/20/2007	3	100.00	98.49	100.00

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between control pins indicated both HP and TP were elevated by 0.03ft in the 7/07 survey, suggesting BM have sunk 0.03ft since the setup in 6/07.
(c) The control pins were stable since 7/07.
(d) Elevation datums of 7/07 and 10/07 for WSE surveys were needed to be corrected to the 6/07 datum.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/1/2007	95.96
7/18/2007	95.81
10/20/2007	96.05

The above WSEs have reflected the 0.03ft datum correction made to the July and Oct surveys.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/1/2007	126.4
7/18/2007	89.9
10/20/2007	160.8

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/1/2007	0.462%	123.5
7/18/2007	0.127%	79
10/20/2007	0.240%	100

The slope S=0.462% of 6/1/2007 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/1/2007	94.21
7/18/2007	94.36
10/20/2007	94.25
max Invert	94.36
SZF	94.36

(1) Transect invert is the lowest elevation of the cross-section

(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/1/2007	126.4	95.96	95.95	-0.01	IFG4
2nd	7/18/2007	89.9	95.81	95.81	0.00	IFG4
3rd	10/20/2007	160.8	96.05	96.06	0.01	IFG4

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 89.9cfs, 126.4cfs, and 160.8cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/1/2007	126.4	Y
7/18/2007	89.9	Y
10/20/2007	160.8	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

IFG4 Data Deck

Stream: Upper Talarik Creek

Reach: UT-D

Site/TR: 07-UTC2-RN2

Habitat Type: Run

River Kilometer: 30.04

Stream: **Upper Talarik Creek**
Reach: **D**
Site Name: **07-UTC2-RN2**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/1/2007	1	100.00	100.13	98.18
2nd	7/18/2007	2	100.00	100.14	98.18
3rd	10/19/2007	3	100.00	100.14	98.18

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between control pins were within 0.01ft.
Small elevation changes indicated survey datum was stable during the survey period.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/1/2007	96.63
7/18/2007	96.36
10/19/2007	96.87

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/1/2007	125.7
7/18/2007	76.5
10/19/2007	167.3

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/1/2007	0.454%	187.3
7/18/2007	0.405%	195
10/19/2007	0.396%	192

The slope S=0.454% of 6/1/2007 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/1/2007	94.23
7/18/2007	94.16
10/19/2007	94.27
max Invert	94.27
SZF	94.27

(1) Transect invert is the lowest elevation of the cross-section

(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/1/2007	125.7	96.63	96.66	0.03	IFG4
2nd	7/18/2007	76.5	96.36	96.35	-0.01	IFG4
3rd	10/19/2007	167.3	96.87	96.86	-0.01	IFG4

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE

(b) Maximum WSE calibration error 0.03ft is within acceptable range.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 76.5cfs, 125.7cfs, and 167.3cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/1/2007	125.7	Y
7/18/2007	76.5	Y
10/19/2007	167.3	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Stream: Upper Talarik Creek

Reach: UT-D

Site/TR: 05-UTC2-RF1

Habitat Type: Riffle

River Kilometer: 32.36

Stream: **Upper Talarik Creek**
Reach: **D**
Site: **05-UTC2-RF1**
Habitat Type: **Riffle**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/16/2005	1	100.00	100.02	101.58
2nd	7/19/2005	2	100.00	100.02	101.57
3rd	8/16/2005	3	100.00	100.01	101.57
4th	7/24/2006	4	100.00	100.04	101.54
5th	4/6/2007	5	100.00	100.13	101.55

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and HP were within 0.02ft between 2005 and 2006. Small relative elevation changes indiated the two pins were stable in that period.
(c) HP moved 0.11ft in 2007 from the 2005 datum. No corrections to the WSEs needed, because the hydraulics of 4/6/07 survey were affected by heavy ice, and were not used for modeling.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/16/2005	97.30
7/19/2005	97.09
8/16/2005	97.03
7/24/2006	97.13
4/6/2007	97.46

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/16/2005	136.5
7/19/2005	
8/16/2005	78.4
7/24/2006	108.9
4/6/2007	19.5

No flow was measured on 7/19/05 when only substrate was surveyed.
Flow of 4/6/07 survey was affected by ice. Discharge may not be accurate.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/16/2005	0.585%	80.4
7/19/2005	0.712%	80.0
8/16/2005	0.712%	80.0
7/24/2006	0.800%	60.0
4/6/2007	-	-

No longitudinal WSE slope was surveyed during the 4/6/07 site visit.
The slope S=0.585% of 6/16/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/16/2005	95.60
7/19/2005	
8/16/2005	95.73
7/24/2006	95.63
4/6/2007	96.06
max Invert	95.73
SZF	95.73

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/19/05.
(4) Invert of 4/6/07 was not used to determine SZF because of anchor ice in the channel that resulted in elevated bed elevation.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/16/2005	136.5	97.30	97.28	-0.02	IFG4
2nd	7/19/2005		97.09			
3rd	8/16/2005	78.4	97.03	97.01	-0.02	IFG4
4th	7/24/2006	108.9	97.13	97.16	0.03	IFG4
5th	4/6/2007	19.5	97.46			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured in 7/19/05 trip.
(d) Photos of 4/6/07 showed the entire channel was covered in ice. Hydraulics were impacted by ice and thus not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 78.4cfs, 108.9cfs, and 136.5cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/16/2005	136.5	Y
7/19/2005		
8/16/2005	78.4	Y
7/24/2006	108.9	Y
4/6/2007	19.5	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Stream: Upper Talarik Creek

Reach: UT-D

Site/TR: 04-UTC-RF3

Habitat Type: Riffle

River Kilometer: 34.62

Stream: **Upper Talarik Creek**
Reach: **D**
Site: **04-UTC-RF3**
Habitat Type: **Riffle**

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	TP
1	7/20/2005	100.00	99.93	97.74
2	8/16/2005	100.00	99.92	97.74
3	9/7/2005	100.00	99.93	97.75
4	7/24/2006	100.00	99.88	97.71
5	4/6/2007	100.00	99.91	97.60

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between any of two pins were within 0.01ft in 2005. HP was lowered 0.05ft and TP 0.03ft in 2006, suggesting BM may have risen by at least 0.03ft in 2006. Therefore, added 0.03ft to the HI of 2006 WSE survey to correct WSEs to the initial datum set up in 2005.
(c) No photos of 4/6/07 were available, but the field notes indicated ice on waters edge.
(d) The control pins moved more in 2007 but no corrections were applied to the WSEs because the hydraulics were impacted by ice and they were not used in the modeling.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/20/2005	95.63
8/16/2005	95.53
9/7/2005	96.10
7/24/2006	95.58
4/6/2007	95.35

The 7/24/06 WSE has reflected a 0.03ft correction due to the possible pin (BM) movement.
No corrections to 4/6/08 WSEs were made.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/20/2005	
8/16/2005	57.6
9/7/2005	216.1
7/24/2006	70.7
4/6/2007	50.0

(a) Discharge was not measured on 7/20/05

(b) Hydraulics of 4/6/07 was affected by ice. Measured flow may not be accurate.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/20/2005	0.686%	196.7
8/16/2005	0.788%	183.9
9/7/2005	0.792%	190.6
7/24/2006	0.802%	113.5
4/6/2007	0.742%	236.0

The slope S=0.788% of 8/16/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/20/2005	94.25
8/16/2005	94.23
9/7/2005	94.20
7/24/2006	94.28
4/6/2007	94.25
max Invert	94.28
SZF	94.28

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) Invert of 7/20/05 survey was not used to determine SZF due to no flow measured.
(4) Transect profile of 4/6/07 was affected by ice. The invert was not used to determine SZF.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1	7/20/2005		95.63			
2	8/16/2005	57.6	95.53	95.52	-0.01	IFG4
3	9/7/2005	216.1	96.10	96.09	-0.01	IFG4
4	7/24/2006	70.7	95.58	95.60	0.02	IFG4
5	4/6/2007	50.0	95.35			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range.
(c) No discharge was measured in 7/20/05 trip.
(d) No photos of 4/6/07 site visit were available, but the field notes indicated ice on waters edge.
The transect profile survey was not complete, suggesting hydraulics were impacted by the ice.
Therefore, the hydraulics were not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 57.6cfs, 70.7cfs, and 216.1cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/20/2005		
8/16/2005	57.6	Y
9/7/2005	216.1	Y
7/24/2006	70.7	Y
4/6/2007	50.0	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1	7/20/2005	99.77	99.29	100.25
2	8/16/2005	99.77	99.29	100.25
3	9/7/2005	99.77	99.29	100.25
4	7/24/2006	99.77	99.41	100.39
5	4/6/2007	99.77	99.34	100.52

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) No relative elevation changes between any of two pins in 2005, indicating all control pins were stable in that period.
(c) Pins were disturbed in 2006. The relative elevation showed HP and TP elevations increased 0.12ft-0.14ft, indicating BM sunk that amount in 2006 from 2005. Therefore, the HI for WSE survey was lowered 0.12ft to correct to the 2005 BM datum.
(c) Pins were further disturbed in 2007 with inconsistent amount for HP and TP. We assumed HP was stable (because it had less movement than TP), and BM moved up 0.07ft (=99.41-99.34) from 2006. As the result, the HI for the WSE survey was reduced 0.05ft (=0.12ft-0.07ft or 99.34ft-99.24ft) to correct to the 2005 BM datum.

calibration notes

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/20/2005	97.63
8/16/2005	97.46
9/7/2005	98.27
7/24/2006	97.58
4/6/2007	97.30

The 7/24/06 and 4/6/07 WSEs have reflected a 0.12ft and a 0.05ft, respectively, corrections.

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/20/2005	
8/16/2005	71.3
9/7/2005	238.3
7/24/2006	94.1
4/6/2007	56.0

No flow was measured on 7/20/05 when only substrate was surveyed.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/20/2005	0.154%	104.0
8/16/2005	0.202%	148.7
9/7/2005	0.236%	169.2
7/24/2006	0.125%	104.0
4/6/2007	0.267%	191.0

The slope S=0.202% of 8/16/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/20/2005	95.38
8/16/2005	95.36
9/7/2005	95.27
7/24/2006	95.18
4/6/2007	95.20
max Invert	95.36
SZF	94.28

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) Invert of 7/20/05 survey was not used to determine SZF due to no flow measured.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1	7/20/2005		97.63			
2	8/16/2005	71.3	97.46	97.44	-0.02	IFG4
3	9/7/2005	238.3	98.27	98.27	0.00	IFG4
4	7/24/2006	94.1	97.58	97.61	0.03	IFG4
5	4/6/2007	56.0	97.30	97.31	0.01	IFG4

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured in 7/20/05 trip.
(d) Field notes of 4/6/07 indicated ice had no contact with water, and thus the measured data was included for the hydraulic modeling. No photos were available for the trip.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 56.0cfs, 71.3cfs, 94.1cfs, and 238.3cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/20/2005		
8/16/2005	71.3	Y
9/7/2005	238.3	Y
7/24/2006	94.1	Y
4/6/2007	56.0	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Site Name: **05-UTC2-RN2**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/16/2005	1	100.00	100.73	98.82
2nd	7/19/2005	2	100.00	100.72	98.81
3rd	8/16/2005	3	100.00	100.73	98.82
4th	7/24/2006	4	100.00	100.62	98.86
5th	4/6/2007	5	100.00	100.78	98.89

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between the control pins were within 0.01ft in 2005.
Small elevation changes indicated pins were stable in that period.
(c) The 2006 survey showed the pins were disturbed with inconsistent amount for HP and TP.
Not able to determine the amount of movement of the survey datum from the survey results.
(d) Level loop results of 2007 showed HP and TP were 0.05ft to 0.07ft, respectively, higher than the 2005 elevations, suggesting they were relatively more stable than BM between 2005 and 2007.
(e) From the relative elevation changes among the pins, it was estimated that BM was elevated 0.04ft in 2006 and 0.07ft in 2007, both from the initial datum set up in 2005, with the assumption that TP was stable during the 2-year period.

calibration notes

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/16/2005	96.96
7/19/2005	96.82
8/16/2005	96.74
7/24/2006	96.83
4/6/2007	96.61

The WSEs in the above table have reflected the datum corrections of 0.04ft and 0.07ft, respectively, to the 2006 and 2007 surveys.

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/16/2005	120.5
7/19/2005	
8/16/2005	68.3
7/24/2006	91.3
4/6/2007	46.8

No flow was measured on 7/19/05 when substrate was surveyed.
Photos of 4/6/08 showed ice hanging over the right side of the channel bank and the transect profile survey indicated the water column near the right shore was occupied by ice. It appeared hydraulics were affected by ice and thus not used in modeling.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/16/2005	0.123%	146.6
7/19/2005	0.130%	146.0
8/16/2005	0.107%	215.3
7/24/2006	0.103%	126.0
4/6/2007	0.104%	182.6

The slope S=0.123% of 6/16/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/16/2005	95.06
7/19/2005	
8/16/2005	95.04
7/24/2006	95.13
4/6/2007	95.06
max Invert	95.13
SZF	95.33

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/19/05.
(4) Invert of 4/6/07 was not used to determine SZF because of anchor ice in the channel near the right water edge.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/16/2005	120.5	96.96	96.95	-0.01	IFG4
2nd	7/19/2005		96.82			
3rd	8/16/2005	68.3	96.74	96.73	-0.01	IFG4
4th	7/24/2006	91.3	96.83	96.84	0.01	IFG4
5th	4/6/2007	46.8	96.61			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) No discharge was measured during the 7/19\/05 site visit.
(d) Photos of 4/6/07 showed the right side of the channel was covered in ice.
Hydraulics were impacted by the ice and thus not used for modeling.

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 68.3cfs, 91.3cfs, and 120.5cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/16/2005	120.5	Y
7/19/2005		
8/16/2005	68.3	Y
7/24/2006	91.3	Y
4/6/2007	46.8	

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Site Name: 05-UTC2-RF2
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/17/2005	1	100.00	99.01	99.12
2nd	7/20/2005	2	100.00	99.06	99.18
3rd	8/15/2005	3	100.00	99.03	99.15
4th	7/25/2006	4	100.00	99.08	99.15
5th	4/6/2007	5	100.00	99.15	99.26

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between the pins showed elevations of HP and TP continued to increase during the 2005-2007 period, which suggested BM continued to sink during that period.
(c) Based on the survey results, 0.05ft, 0.02ft, and 0.05ft were subtracted from the HI's for WSE surveys of 7/20/06, 8/15/05, and 7/25/06 site visits, respectively, to correct to the initial datum set up on 6/17/05.
(d) Photos of 4/6/07 trip showed the site was covered in thick ice and frozen water in the channel. Surveyed data of 4/6/07 were not used for modeling due to the ice impact.

Measured WSE:

There were three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/17/2005	95.78
7/20/2005	95.68
8/15/2005	95.51
7/25/2006	95.76
4/6/2007	95.70

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/17/2005	113.2
7/20/2005	
8/15/2005	66.8
7/25/2006	110.3
4/6/2007	46.1

No flow was measured on 7/20/05 when only substrate was surveyed.
Flow of 4/6/07 survey was affected by ice. Discharge may not be accurate.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/17/2005	0.996%	94.4
7/20/2005	1.039%	94.3
8/15/2005	0.904%	94.0
7/25/2006	1.198%	128.5
4/6/2007	1.070%	204.7

The slope S=0.996% of 6/17/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/17/2005	94.28
7/20/2005	
8/15/2005	94.31
7/25/2006	94.46
4/6/2007	94.60
max Invert	94.46
SZF	95.73

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/20/05.
(4) Invert of 4/6/07 was not used to determine SZF because of anchor ice in the channel that resulted in elevated bed elevation.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

IFG4 method was first used to calibrate the WSE, but resulted in hydraulics not able to be fully justified, and as the result, MANSQ with β=0.0 was tried and used for the WSE calibration.

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/17/2005	113.2	95.78	95.78	0.00	MANSQ
2nd	7/20/2005		95.68			
3rd	8/15/2005	66.8	95.51	95.54	0.03	MANSQ
4th	7/25/2006	110.3	95.76	95.77	0.01	MANSQ
5th	4/6/2007	46.1	95.70			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range.
(c) No discharge was measured during the 7/20\/05 site visit.
(d) Photos of 4/6/07 showed the entire channel was covered in ice.
Hydraulics were impacted by the ice and thus not included in hydraulic modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 66.8cfs, 110.3cfs, and 113.2cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/17/2005	113.2	Y
7/20/2005		
8/15/2005	66.8	Y
7/25/2006	110.3	
4/6/2007	46.1	

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

MANSQ Data Deck

Stream: Upper Talarik Creek

Reach: UT-E

Site/TR: 04-UTC-IC1

Habitat Type: Island Complex

River Kilometer: 37.91

Stream: **Upper Talarik Creek**
Reach: **E**
Site Name: **04-UTC-IC1**
Habitat Type: **Island Complex**

(1) Field Data

Level Loop and Headpin Elevations:

Flow	Date	BM	HP	AP	TP
1st	7/20/2005	100.00	97.66	97.63	97.94
2nd	8/16/2005	100.00	97.67	97.64	97.95
3rd	9/6/2005	100.00	97.67	97.64	97.95
4th	7/3/2006	100.00	97.69	97.64	97.94
5th	7/24/2006	100.00	97.68	97.65	97.95
6th	4/8/2007	100.00	97.62	97.61	97.90

(a) Elevations of control pins (BM, HP, AP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between any of two pins were within ±0.01ft in 2005-2006 period.
Small changes indicated the control pins were stable in that period.
(c) The control pins moved as much as 0.04ft in 2007 from the initial setup in 2005.
No corrections were needed for the 2007 WSEs for the hydraulic calibration purpose, because the hydraulics of 2007 were not used in the modeling due to ice impact.

calibration notes

Measured WSE:

This transect is an island complex with a main (right) channel and a side (left) channel.
There were three WSEs (Right, Mid, and Left) measured across the main channel for each flow, and the average of the three was used as transect representative WSE for modeling.

	WSE (ft)	
Date	Left (side)	Right (main)
7/20/2005	95.66	95.88
8/16/2005	95.59	95.74
9/6/2005	96.67	96.69
7/3/2006	95.80	95.87
7/24/2006	96.77	95.87
4/8/2007	96.42	96.41

(1) Right channel WSEs were used for modeling because it carried the majority of flow.
Bed profile of left channel was adjusted with the amount of the WSE difference between the two channels.
(2) WSE of 4/8/07 survey was affected by ice.

Discharge:

All measured discharges are listed in the following table.

	Q (cfs)		
Date	Left (side)	Right (main)	Total
7/20/2005			
8/16/2005	0.2	63.5	63.7
9/6/2005	45.1	261.1	306.2
7/3/2006			
7/24/2006	0.8	85.0	85.8
4/8/2007	5.2	62.9	68.2

No discharges were measured during the 7/20/05 and 7/3/06 surveys.
Measured flow of 4/8/07 may not be accurate due to anchor ice in the channel.

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Left (Side Channel)

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/20/2005	0.050%	39.8
8/16/2005	0.092%	43.3
9/6/2005	0.364%	107.1
7/3/2006	NA	NA
7/24/2006	0.036%	83.3
4/8/2007	NA	NA

Left (Side Channel)

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/20/2005	0.363%	162.6
8/16/2005	0.354%	147
9/6/2005	0.518%	166
7/3/2006	0.387%	142
7/24/2006	0.360%	119.6
4/8/2007	NA	NA

The slope S=0.354% of 8/16/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Right (main) Channel Invert (ft)
7/20/2005	94.43
8/16/2005	94.44
9/6/2005	94.49
7/3/2006	94.51
7/24/2006	94.47
4/8/2007	94.51
max Invert	94.49
SZF	94.49

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) Inverts of 7/20/05 and 7/3/06 surveys were not used to determine SZF due to no flows measured.
(4) Transect profile of 4/8/07 was affected by ice. The invert was not used to determine SZF.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	7/20/2005		95.88			
2nd	8/16/2005	63.7	95.74	95.74	0.00	IFG4
3rd	9/6/2005	306.2	96.69	96.69	0.00	IFG4
4th	7/3/2006		95.87			
5th	7/24/2006	85.8	95.87	95.88	0.01	IFG4
6th	4/8/2007	68.2	96.41			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) No discharges were measured in the 7/20/05 and 7/3/06 trips.
(d) No photos of 4/8/07 site visit were available, but the field notes indicated the TP was under 8 feet of hard snow, and only small portion of water was "open no ice".
(e) Hydraulics were impacted by ice and thus were not used in the modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 63.7cfs, 85.8cfs, and 306.2cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/20/2005		
8/16/2005	63.7	Y
9/6/2005	306.2	Y
7/3/2006		
7/24/2006	85.8	Y
4/8/2007	68.2	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Stream: Upper Talarik Creek
Reach: E
Site: 08-UTC2-MS1

(1) Field Data

Level Loop and Headpin Elevations:

Date	BM1	BM2	BM3	BM4	BM5
6/20/2008	100.00	99.25	98.26	99.02	97.30
7/18/2008	100.00	99.26	98.27	99.02	97.30
8/16/2008	100.00	99.26	98.27	99.02	97.30

(a) Elevations of control pins (BMs) are taken from the first half of each level loop survey
(b) Relative elevation changes between control pins were within 0.01ft.
(c) The small relative elevation changes indicated all control pins were stable over the survey period.

Measured WSE:

There were two WSEs (Right and Left) measured on each channel/transect for each flow, and the average of the two was used as representative WSE for modeling.

Date	Measured WSE (ft)										
	TR-1	TR-2		TR-3		TR-4		TR-5		TR-6	
		LC	RC	LC	RC	LC	RC	LC	RC	Main	Side
6/20/2008	96.73	96.79	96.98	97.36	**97.28**	97.48	**97.96**	97.68	98.27	98.32	97.88
7/18/2008	96.07	96.28	96.40	96.85	96.81	96.96	97.43	97.05	97.74	97.76	97.28
8/16/2008	95.91	96.16	96.21	96.79	96.69	96.86	97.31	96.94	97.58	97.60	97.16

For TRs with multiple channels, average WSE of right channel is used for hydraulic calibration because the majority of water flows through right channels.
WSEs of RC and LC are not the same for the Island Complex transects (i.e., TR-2 to TR-6), but the WSEs of right channels are used for hydraulic calibration, because most of the water flows through the right channels. The bed bathymetry of LCs is adjusted, as the result of using Right WSE for modeling, with the amount of the WSE difference between RC and LC, so that both channels (RC and LC) would have the same WSE, as required by the IFG4 model.

calibration notes

Discharge:

All measured flows are listed in the following table.

Date	Measured Discharge (cfs)						Ave Q (cfs)
	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6	
6/20/2008	215.8	232.4	235.7	221.5	235.4	202.5	**223.9**
7/18/2008	115.3	115.7	110.4	110.4	107.3	104.3	**110.6**
8/16/2008	93.3	90.6	92.6	89.2	87.3	88.1	**90.2**

The flows shown above are the total discharge of each transect that may include multiple channels.
Average Q of all transects was used as the representative flows for the site for modeling.

Longitudinal WSE Slope and Stations:

Slopes are calculated using the measured WSEs and longitudinal distances.

Longitudinal Stations						
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
LB	0.0	207.0	176.0	46.0	124.0	133.0
RB	0.0	230.0	149.0	217.0	147.0	9.0
repr. dist.	0.0	230.0	149.0	217.0	147.0	9.0
Station	0.0	230.0	379.0	596.0	743.0	752.0

Note: Right bank distance is used because right channel carries the majority of water.
The 9ft from TR6 to TR5 is the distance between the two HP's and may be less than the actual distance along the waters edge.

Slope						
TR	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/20/2008	-	0.11%	0.15%	0.21%	0.21%	0.211%
7/18/2008	-	0.14%	0.20%	0.23%	0.22%	0.225%
8/16/2008	-	0.13%	0.20%	0.23%	0.22%	0.225%

Slope of each TR is the average slope from TR-1, which is the ratio of WSE difference from TR-1 to the distance from TR-1.
The TR-6 slope S=0.211% of 6/20/2008 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

	TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/20/2008	93.53	94.08	95.48	94.66	94.57	94.22
7/18/2008	93.57	94.10	95.46	94.68	94.64	94.26
8/16/2008	93.51	94.11	95.39	94.66	94.68	94.30
Invert	93.57	94.11	95.48	94.68	94.68	94.30
SZF	93.57	94.11	95.48	95.48	95.48	95.48

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
SZF of upstream transect must be no less than that of downstream transect.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

TR-1 WSE calibration

The stream morphology of this site (08-UTC2-MS1) is very complex. A string of islands divided the stream into multiple channels. Water was separated from where each island started and reconnected at where that island ended. TR-1 is a single-channel transect, located immediately below the tip of the most downstream island. Water from the two channels (LC & RC) flanking the most d/s island converged at TR-1, allowing insufficient distance for the flow to become uniform. As the result of the short distance, a single simple method of IFG4 or MANSQ may not be adequate to characterize the WSE~Q behavior for TR-1. Consequently, multiple methods (i.e., IFG4 and MANSQ) were applied to TR-1 and a composite rating curve was developed from the results of the two methods.

The following table summarizes the WSE~Q rating curve calibrations from using IFG4 and MANSQ.
A composite rating curve is developed from the results of the two methods with the weighting factor described below.

Simulation	TR-1 WSE			Weighting	Calibration
Q (cfs)	IFG4	MANSQ	Composite	factor, f_w	Method
40	95.36	95.50	95.50	0.000	MANSQ
50	95.49	95.60	95.60	0.000	MANSQ
60	95.61	95.69	95.69	0.000	MANSQ
70	95.72	95.77	95.77	0.000	MANSQ
80	95.82	95.85	95.85	0.000	MANSQ
90.2	95.91	95.93	95.93	0.000	MANSQ
100	95.99	96.00	96.00	0.000	MANSQ
110.6	96.07	96.07	96.07	0.000	MANSQ

223.9	96.73	96.73	96.73	1.000	IFG4
240	96.80	96.82	96.80	1.000	IFG4
260	96.89	96.91	96.89	1.000	IFG4
280	96.97	97.01	96.97	1.000	IFG4
300	97.05	97.10	97.05	1.000	IFG4
320	97.13	97.19	97.13	1.000	IFG4
340	97.20	97.27	97.20	1.000	IFG4
360	97.27	97.36	97.27	1.000	IFG4
380	97.33	97.44	97.33	1.000	IFG4
400	97.40	97.52	97.40	1.000	IFG4
420	97.46	97.61	97.46	1.000	IFG4
440	97.52	97.69	97.52	1.000	IFG4
470	97.61	97.89	97.61	1.000	IFG4
510	97.72	98.02	97.72	1.000	IFG4
550	97.82	98.14	97.82	1.000	IFG4

Note:

A composite (WSE~Q) rating curve is developed using the following algorithm:

For Q≤110.6cfs(Q_{low}): WSEs from the rating curve of MANSQ method are used for the composite curve

For Q≥223.9cfs(Q_{high}): WSEs from the rating curve of IFG4 are used for the composite curve

For $Q_{low} \le Q \le Q_{high}$: A weighting factor f_w is applied for weighted WSE calculation to develop the composite curve

The weighting for each flow is read

$$f_w=(Q-Q_{low})/(Q_{high}-Q_{low})$$

Then the weighted WSE for the composite curve would be

$$WSE_{Composite}=f_w*WSE_{IFG4}+(1-f_w)WSE_{MANSQ}$$

calibration notes

TR-2 to TR6 WSE calibration:
WSP backwater simulation was applied to calibrate the WSE for the rest of the transects (TR-2 to TR-6).
The calibrated WSEs of TR-1 were used as the d/s boundary condition for the backwater simulation.
The Roughness Modifier (RMOD) calibration is summarized in the following table:

Simul. Q (cfs)	Calibr. RMOD
40.0	1.1006

8/16/2008	90.2	0.02	0.04	0.03	0.00	-0.01	-0.01	MANSQ	WSP	WSP	WSP	WSP	WSP

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.04ft is within the acceptable range.

(3) Velocity calibration

This site has six transects and each transect has 3 velocity/discharge measurements.
Each measured velocity profile was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model.
Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow.
The adjustment of n values was made at the stations where simulated velocities were significantly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)					
		TR-1	TR-2	TR-3	TR-4	TR-5	TR-6
6/20/2008	223.9	Y	Y	Y	Y	Y	Y
7/18/2008	110.6	Y	Y	Y	Y	Y	Y
8/16/2008	90.2	Y	Y	Y	Y	Y	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges.
TR-1 is a single channel transect, and all of its hydraulic parameters appear varying in normal trends.
TR-2 through TR-6 each has very complex bathymetry with islands separating each transect into multiple channels. The hydraulics (velocity and WSE) were generally different in each channel such that the flow did not meet the definition of uniform flow across the transect, a hydraulic condition required when applying Manning's equation. In addition, the Froude number was originally developed for the single-channel transect and may not be applicable to predicting for multiple-channel transect.
As the result, the Manning's n value calculated for the transects with multiple channels may not adequately reflect the roughness of the transect.

Stream: Upper Talarik Creek

Reach: UT-E

Site/TR: 07-UTC2-RN5

Habitat Type: Run

River Kilometer: 42.71

Stream: **Upper Talarik Creek**
Reach: **E**
Site Name: **07-UTC2-RN5**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/2/2007	1	100.00	97.15	97.68
2nd	7/18/2007	2	100.00	97.14	97.64
3rd	9/19/2007	3	100.00		97.64
4th	10/20/2007	4	100.00	97.13	97.65

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and HP were within 0.02ft. The small changes suggested the survey datum was stable.
(c) Level loop of 9/19/07 was not completed due to unsafe flow condition from a recent storm.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, except the September site visit, which had only one WSE on the right edge of the channel. The average of the three WSEs was used as transect representative WSE for modeling.

Date	WSE (ft)
6/2/2007	94.99
7/18/2007	94.66
9/19/2007	96.76
10/20/2007	95.39

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)	
6/2/2007	73.8	
7/18/2007	44.8	
9/19/2007		
10/20/2007	76.2	ice

No discharge was measured on 9/19/07 due to unsafe high flow condition.
There was ice on water edge during the 10/20/07 trip. Hydraulics may be impacted by ice.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/2/2007	0.144%	83.4
7/18/2007	0.060%	99.4
9/19/2007	0.116%	121
10/20/2007	0.160%	75

The slope S=0.144% of 6/2/2007 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/2/2007	92.49
7/18/2007	92.51
9/19/2007	
10/20/2007	92.59
max Invert	92.51
SZF	92.51

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) Invert of 10/20/07 was not used to determine SZF because hydraulics of this date were affected by ice.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/2/2007	73.8	94.99	94.99	0.00	IFG4
2nd	7/18/2007	44.8	94.66	94.66	0.00	IFG4
3rd	9/19/2007		96.76			
4th	10/20/2007	76.2	95.39			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) No flow was measured during the 9/19/07 site visit due to unsafe high flow condition.
(d) Hydraulics of 10/20/07 were affected by ice. Plotting the WSE~Q data of all three surveys shows the water was possibly backed up by about 0.4ft at the site. Due to the backwater effect, the hydraulics were not used for modeling.
(e) This transect has only two pairs of WSE~Q available, but Log-log (IFG4 method) relationship was still applied when calibrating the WSE~Q rating curve. Usually MANSQ would be applied for the calibration when only two pairs of WSE~Q can be used, but MANSQ calibration results showed erratic WSE-Q relationship that can not be applied at flows greater than 75cfs. As the result, log-log relationship was still applied to WSE calibration.

calibration notes

(3) Velocity calibration

This site has one transect with two complete velocity/discharge measurements, including 44.8cfs and 73.8cfs. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/2/2007	73.8	Y
7/18/2007	44.8	Y
9/19/2007		
10/20/2007	76.2	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Site: 07-UTC2-RN4
Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/2/2007	1	100.00	98.64	98.67
2nd	7/18/2007	2	100.00	98.61	98.71
3rd	9/19/2007	3	100.00	98.62	98.73
4th	10/18/2007	4	100.00	98.61	98.73

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and HP were no more than 0.03ft relative to the datum initially set up in 6/07.
(c) Consistent elevations of the control pins in the last three surveys suggested all control pins had been stable since the 7/18/07 survey.
(d) Unable to determine how much the survey datum was disturbed between the first (6/07) and second (7/07) level loop surveys, but
(e) The disturbance should be relatively small (within ±0.02 between BM and HP), and thus it was decided no adjustments would be applied to correcting the WSEs.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/2/2007	95.62
7/18/2007	95.43
9/19/2007	97.15
10/18/2007	95.92

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/2/2007	73.4
7/18/2007	44.5
9/19/2007	348.2
10/18/2007	117.0

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/2/2007	0.214%	84
7/18/2007	-0.039%	51.8
9/19/2007	0.067%	104
10/18/2007	0.232%	99

The slope S=0.214% of 6/2/2007 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/2/2007	93.72
7/18/2007	93.88
9/19/2007	93.95
10/18/2007	93.92
max Invert	93.95
SZF	93.95

(1) Transect invert is the lowest elevation of the cross-section

(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/2/2007	73.4	95.62	95.66	0.04	IFG4
2nd	7/18/2007	44.5	95.43	95.36	-0.07	IFG4
3rd	9/19/2007	348.2	97.15	97.09	-0.06	IFG4
4th	10/18/2007	117.0	95.92	96.00	0.08	IFG4

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.08ft is marginally acceptable.

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 44.5cfs, 73.4cfs, 117.0cfs, and 348.2cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/2/2007	73.4	Y
7/18/2007	44.5	Y
9/19/2007	348.2	Y
10/18/2007	117.0	Y

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Habitat Type: Run

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/19/2005	1	100.00	98.32	98.88
2nd	7/20/2005	2	100.00	98.31	98.88
3rd	8/15/2005	3	100.00	98.31	98.88
4th	6/28/2006	4	100.00	98.41	98.92
5th	4/10/2007	5	100.00	98.71	99.03

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative pin elevation changes were within 0.01ft in 2005, indicating all three pins were stable in that period.
(c) HP and TP elevations rose 0.09ft and 0.04ft, respectively, in 2006, but it was unclear which pin(s) had moved.
(d) Because the shift of 0.04ft between BM and TP was not too significant, it was decided no adjustment would be applied to correcting the WSEs surveyed in 2006 to 2005 datum.
(e) Hydraulics of 4/10/2007 survey were affected by ice and were not be included for modeling

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/19/2005	96.08
7/20/2005	95.85
8/15/2005	95.75
6/28/2006	95.94
4/10/2007	98.85

WSE of 4/10/07 was affected by ice. Photos showed anchor ice in channel and on waters edge.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/19/2005	55.6
7/20/2005	
8/15/2005	18.8
6/28/2006	39.9
4/10/2007	31.8

(a) No flow was measured on 7/20/05.

(b) Transect profile of 4/10/07 survey showed the bed was elevated for more than 3 feet, indicating the channel was filled with anchor ice. Hydraulics were impacted by ice and no used for modeling.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/19/2005	0.067%	104
7/20/2005	0.038%	104
8/15/2005	0.037%	80.5
6/28/2006	0.015%	65
4/10/2007	0.202%	128.6

The slope S=0.067% of 6/19/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/19/2005	93.78
7/20/2005	
8/15/2005	93.95
6/28/2006	93.99
4/10/2007	97.25
max Invert	93.99
SZF	93.99

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/20/05.
(4) Invert of 4/10/07 survey was not used to determine SZF because hydraulics was impacted by ice.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR1	TR1	TR1	
1st	6/19/2005	55.6	96.08	96.06	-0.02	IFG4
2nd	7/20/2005		95.85			
3rd	8/15/2005	18.8	95.75	95.75	0.00	IFG4
4th	6/28/2006	39.9	95.94	95.96	0.02	IFG4
5th	4/10/2007	31.8	98.85			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range
(c) No flow was measured during the 7/20/05 site visit.
(d) Hydraulics of 4/10/07 were affected by ice, and therefore were not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 18.8cfs, 39.9cfs, and 55.6cfs. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/19/2005	55.6	Y
7/20/2005		
8/15/2005	18.8	Y
6/28/2006	39.9	Y
4/10/2007	31.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

IFG4 Data Deck

Stream: Upper Talarik Creek

Reach: UT-F

Site/TR: 05-UTC3-RN2

Habitat Type: Run

River Kilometer: 52.01

Stream: **Upper Talarik Creek**
Reach: **F**
Site Name: **05-UTC3-RN2**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/18/2005	1	100.00	97.90	97.43
2nd	7/20/2005	2	100.00	97.98	97.49
3rd	8/15/2005	3	100.00	97.97	97.49
4th	7/8/2006	4	100.00	98.09	97.55
5th	4/8/2007	5	100.00	98.15	97.49

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative pin elevation changes from 6/05 to 7/05 showed BM may have sunken 0.06ft to 0.08ft. Pins stabilized in the 8/05 survey.
(c) The 7/06 survey results suggested (1) BM have sunken an additional 0.06ft to 0.12ft from 8/05, (2) BM were lowered or (3) combination of sinking and rising of all pins.
(d) Adjustments were needed to correct all WSEs to reference to the 6/05 datum.
(e) Hydraulics of 4/8/07 survey were impacted by ice and not used in modeling.

calibration notes

Measured WSE:

The level loop results showed the control pins moved randomly over the 2-year survey period. As the result, it was difficult to estimate the accurate movement of the datum shift in each survey. Instead of using the pin elevation changes to determine the required adjustment to the datum, it was assumed the bed was stable from 2005 to 2006. With the assumption, the adjustments to the WSEs of 7/20/5, 8/15/05 and 7/8/06 would be -0.15ft, -0.15ft, and -0.10ft, respectively. After applying the adjustments, the three bed profiles surveyed in 2005 and 2006 were reasonably matched in the center portion of the transect.

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/18/2005	95.49
7/20/2005	95.05
8/15/2005	95.02
7/8/2006	95.46
4/8/2007	98.36

The WSEs of 7/05, 8/05, 7/06 have reflected the adjustments due to datum shift.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/18/2005	42.4
7/20/2005	
8/15/2005	11.6
7/8/2006	37.6
4/8/2007	7.6

(a) No flow was measured in 7/20/05 trip.

(b) Measured flow of 4/8/07 was affected by ice. There were no photos available for this site, but the photos of a higher site, 05-UTC3-RF2 (~3.2 miles upstream), showed the entire channel was covered in ice, Also the photos of a lower site, 05-UTC3-RN3 (~2.0 miles downstream), showed the ice still occupied waters edge. The photos of both sites were taken on 4/10/07.

(c) Transect profile of 4/8/07 survey showed the channel bottom was elevated for more than 4 feet, indicating the channel was filled with anchor ice.

(d) Hydraulics of 4/8/07 was impacted by ice and not used for modeling.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/18/2005	0.506%	63.3
7/20/2005	0.648%	63
8/15/2005	0.671%	51
7/8/2006	0.389%	77
4/8/2007	0.269%	63

The slope S=0.506% of 6/18/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/18/2005	94.29
7/20/2005	
8/15/2005	94.22
7/8/2006	94.46
4/8/2007	97.46
max Invert	94.46
SZF	94.46

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/20/05
(4) Invert of 4/8/07 survey was not used to determine SZF because hydraulics was impacted by ice

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/18/2005	42.4	95.49	95.50	0.01	IFG4
2nd	7/20/2005		95.05			
3rd	8/15/2005	11.6	95.02	95.02	0.00	IFG4
4th	7/8/2006	37.6	95.46	95.44	-0.02	IFG4
5th	4/8/2007	7.6	98.36			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range
(c) No flow was measured during the 7/20/05 site visit.
(d) Hydraulics of 4/10/07 were affected by ice and were not used for modeling

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 11.6cfs, 37.6cfs, and 42.4cfs. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/18/2005	42.4	Y
7/20/2005		
8/15/2005	11.6	Y
7/8/2006	37.6	
4/8/2007	7.6	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

IFG4 Data Deck

Stream: Upper Talarik Creek

Reach: UT-F

Site/TR: 05-UTC3-PL1

Habitat Type: Pool

River Kilometer: 56.65

Stream: Upper Talarik
Reach: F
Site Name: 05-UTC3-PL1
Habitat Type: Pool

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/18/2005	1	100.00	99.59	97.73
2nd	7/21/2005	2	100.00	99.59	97.73
3rd	8/15/2005	3	100.00	99.58	97.71
4th	6/28/2006	4	100.00	99.62	97.79
5th	4/8/2007	5	100.00	99.62	97.91

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and HP were within 0.03ft during the 2005-2006 period. This suggested survey datum may have been moved slightly.
(c) It was decided no adjustments to the WSEs surveyed in 2006 would be applied, because the 0.03ft elevation shift was marginally acceptable.
(d) Hydraulics of 2007 survey were affected by the beaver dam and thus not used in modeling.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/18/2005	96.26
7/21/2005	95.97
8/15/2005	95.87
6/28/2006	95.95
4/8/2007	97.81

WSE of 4/8/07 was backed up by beaver dam

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/18/2005	18.1
7/21/2005	
8/15/2005	6.6
6/28/2006	12.9
4/8/2007	12.8

(a) No discharge was measured on 7/21/05, when substrate was surveyed.
(b) WSE of 4/8/07 was backed up by the downstream beaver dam. Hydraulics were not used in modeling.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/18/2005	0.208%	28.9
7/21/2005	0.107%	28.0
8/15/2005	0.036%	28.0
6/28/2006	0.237%	38.0
4/8/2007	-0.035%	28.9

The slope S=0.208% of 6/18/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/18/2005	93.36
7/21/2005	
8/15/2005	93.37
6/28/2006	93.35
4/8/2007	93.61
max Invert	93.37
SZF	92.51

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/21/05.
(4) Invert of 4/8/07 was not used to determine SZF because the bed profile had changed significantly from the one initially surveyed in 2005.

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR1	TR1	TR1	
1st	6/18/2005	18.1	96.26	96.23	-0.03	IFG4
2nd	7/21/2005		95.97			
3rd	8/15/2005	6.6	95.87	95.78	-0.09	IFG4
4th	6/28/2006	12.9	95.95	96.07	0.12	IFG4
5th	4/8/2007	12.8	97.81			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE

(b) Maximum WSE calibration error 0.12ft is marginally acceptable.
Not able to determine the cause to the relatively large calibration errors.

(c) No flow was measured during the 7/21/05 site visit.

(d) Hydraulics of 4/8/07 were affected by the downstream beaver dam, which backed up water for more than 2 feet at the site.

(e) Hydraulics of 4/8/07 were affected by the downstream beaver dam, which backed up water for more than 2 feet, and thus hydraulics were not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 6.6cfs, 12.9cfs, and 18.1cfs. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/18/2005	18.1	Y
7/21/2005		
8/15/2005	6.6	Y
6/28/2006	12.9	Y
4/8/2007	12.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Habitat Type: Riffle

River Kilometer: 56.83

Stream: **Upper Talarik Creek**
Reach: **F**
Site Name: **05-UTC3-RF1**
Habitat Type: **Riffle**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/18/2005	1	100.00	96.96	99.24
2nd	7/20/2005	2	100.00	96.95	99.23
3rd	8/15/2005	3	100.00	96.95	99.22
4th	6/28/2006	4	100.00	97.00	99.34
5th	4/10/2007	5	100.00	97.01	99.44

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes of the pins were within ±0.01ft in 2005, indicating the control pins were stable in that period.
(c) Survey results showed the pins were disturbed in 2006, with 0.04ft and 0.10ft elevation increase for HP and TP, respectively, relative to BM.
(d) TP continued to rise over the 2-yr period, while TP became stable since 2006. Based on the stability of each pin, it was determine BM should be stable the entire period, and thus no corrections to the survey results were needed.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/18/2005	96.15
7/20/2005	95.95
8/15/2005	95.85
6/28/2006	96.04
4/10/2007	95.94

WSE of 4/10/07 was affected by ice.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/18/2005	21.6
7/20/2005	
8/15/2005	7.8
6/28/2006	13.8
4/10/2007	15.2

(a) No discharge was measured on 7/20/05, when only substrate was surveyed.

(b) Measured flow of 4/10/07 was affected by ice. There were no photos available for this site, but the photos of an upstream site, 05-UTC3-RF2, less than a quarter mile away, taken on the same day, showed the entire stream was covered in ice.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/18/2005	0.576%	76.4
7/20/2005	0.724%	76
8/15/2005	0.757%	70
6/28/2006	0.851%	101
4/10/2007	-	-

No longitudinal WSE slope were surveyed during the 4/10/07 site visit due to ice.
The slope S=0.576% of 6/18/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/18/2005	94.85
7/20/2005	
8/15/2005	95.15
6/28/2006	95.24
4/10/2007	95.04
max Invert	95.24
SZF	95.24

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/20/05.
(4) Invert of 4/10/07 was not used to determine SZF because of ice impact.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/18/2005	21.6	96.15	96.16	0.01	IFG4
2nd	7/20/2005		95.95			
3rd	8/15/2005	7.8	95.85	95.86	0.01	IFG4
4th	6/28/2006	13.8	96.04	96.01	-0.03	IFG4
5th	4/10/2007	15.2	95.94			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range
(c) No flow was measured during the 7/20/05 site visit.
(d) Hydraulics of 4/10/07 were affected by ice, and thus not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 7.8cfs, 13.8cfs, and 21.6cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/18/2005	21.6	Y
7/20/2005		
8/15/2005	7.8	Y
6/28/2006	13.8	Y
4/10/2007	15.2	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

IFG4 Data Deck

Stream: Upper Talarik Creek

Reach: UT-F

Site/TR: 05-UTC3-RF2

Habitat Type: Riffle

River Kilometer: 57.25

Stream: Upper Talarik Creek
Reach: F
Site: 05-UTC3-RF2
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/19/2005	1	100.00	101.39	101.44
2nd	7/21/2005	2	100.00	101.39	101.44
3rd	8/15/2005	3	100.00	101.39	101.44
4th	6/28/2006	4	100.00	101.39	101.42
5th	6/29/2006	6	100.00	101.38	101.43
6th	4/10/2007	5	100.00	101.40	101.61

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes of the pins were within ±0.01ft in 2005-2006, indicating the control pins were stable during that period.
(d) TP rose almost 0.2ft in the 2007 survey, but BM and HP remained stable relative to each other. Elevation datum was based on BM, and thus no corrections were applied to the surveyed elevations.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/19/2005	98.56
7/21/2005	98.45
8/15/2005	98.37
6/28/2006	98.49
6/29/2006	98.57
4/10/2007	98.36

WSE of 4/10/07 was affected by ice. Field photos showed the channel was frozen in ice and field crew used an auger to drill holes to reach water.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/19/2005	16.6
7/21/2005	
8/15/2005	7.1
6/28/2006	13.3
6/29/2006	
4/10/2007	15.4

No flows were measured in the 7/21/05 and 6/29/06 trips.
Hydraulics of 4/10/07 was affected by ice. Photos showed stream was covered in ice.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/19/2005	1.641%	26.2
7/21/2005	1.808%	26
8/15/2005	2.080%	25
6/28/2006	1.379%	29
6/29/2006	1.595%	26
4/10/2007	1.463%	29

The slope S=1.641% of 6/19/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/19/2005	97.56
7/21/2005	
8/15/2005	97.67
6/28/2006	97.79
6/29/2006	97.80
4/10/2007	97.76
max Invert	97.79
SZF	97.79

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/21/05.
(4) Invert of 6/29/06 survey was not used to determine SZF because of no flow measured.
(5) Invert of 4/10/07 survey was not used to determine SZF because hydraulics was impacted by ice.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/19/2005	16.6	98.56	98.55	-0.01	IFG4
2nd	7/21/2005		98.45			
3rd	8/15/2005	7.1	98.37	98.36	-0.01	IFG4
4th	6/28/2006	13.3	98.49	98.50	0.01	IFG4
5th	6/29/2006		98.57			
6th	4/10/2007	15.4	98.36			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range
(c) No flows were measured during the 7/21/05 and 6/29/06 site visits.
(d) Hydraulics of 4/10/07 were affected by ice, and thus not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 7.1cfs, 13.3cfs, and 16.6cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/19/2005	16.6	Y
7/21/2005		
8/15/2005	7.1	Y
6/28/2006	13.3	
6/29/2006		
4/10/2007	15.4	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Stream: Upper Talarik Creek

Reach: UT-F

Site/TR: 05-UTC3-RN1

Habitat Type: Run

River Kilometer: 58.24

Stream: **Upper Talarik Creek**
Reach: **F**
Site: **05-UTC3-RN1**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	Trip	BM	HP	TP
1st	6/18/2005	1	100.00	98.10	98.14
2nd	7/20/2005	2	100.00	98.10	98.15
3rd	8/15/2005	3	100.00	98.09	98.14
4th	6/28/2006	4	100.00	98.10	98.20
5th	4/10/2007	5	100.00	98.01	98.25

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative elevation changes between BM and HP were within 0.01ft in 2005-2006 period. Small changes indicated the two control pins were stable during that period
(d) TP rose 0.06ft in 2006 from 2005. There is no need to correct the WSEs of 2006 because the survey elevation datum was based on BM, which was stable in 2006
(e) Pins were disturbed in the 2007 survey. No corrections were applied to the surveyed WSEs because the hydraulics were impacted by ice and not used in the modeling.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
6/18/2005	95.69
7/20/2005	95.53
8/15/2005	95.40
6/28/2006	95.50
4/10/2007	95.29

WSE of 4/10/07 was affected by ice.

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/18/2005	19.8
7/20/2005	
8/15/2005	8.8
6/28/2006	13.3
4/10/2007	11.7

(a) No flow was measured in the 7/20/05 trip.

(b) Measured flow of 4/10/07 was affected by ice. There were no photos available for this site, but the photos of a nearby site, 05-UTC3-RF2, about half a mile downstream with lower elevation, taken on the same day, showed the entire channel was covered in ice.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/18/2005	1.550%	27.1
7/20/2005	1.852%	27
8/15/2005	1.721%	24
6/28/2006	1.278%	36
4/10/2007	-	-

No longitudinal WSE slope surveyed on 4/10/07 trip "due to Ice U.S. + D.S."

The slope S=1.550% of 6/18/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/18/2005	94.69
7/20/2005	
8/15/2005	94.70
6/28/2006	94.70
4/10/2007	94.59
max Invert	94.70
SZF	94.70

(1) Transect invert is the lowest elevation of the cross-section.
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process.
(3) No transect profile was surveyed on 7/20/05.
(4) Invert of 4/10/07 survey was not used to determine SZF because hydraulics was impacted by ice.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	6/18/2005	19.8	95.69	95.68	-0.01	IFG4
2nd	7/20/2005		95.53			
3rd	8/15/2005	8.8	95.40	95.39	-0.01	IFG4
4th	6/28/2006	13.3	95.50	95.52	0.02	IFG4
5th	4/10/2007	11.7	95.29			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range
(c) No flow was measured during the 7/20/05 site visit.
(d) Hydraulics of 4/10/07 were affected by ice, and were not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 8.8cfs, 13.3cfs, and 19.8cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/18/2005	19.8	Y
7/20/2005		
8/15/2005	8.8	Y
6/28/2006	13.3	
4/10/2007	11.7	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1	7/21/2005	100.00	98.39	100.36
2	8/17/2005	100.00	98.37	100.35
3	9/9/2005	100.00	98.38	100.35
4	6/29/2006	100.00	98.43	100.36
5	7/9/2006	100.00	98.43	100.37
6	4/14/2007	100.00	98.59	100.57

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative pin elevations changes between BM and TP were within ±0.01ft in 2005-2006 period.
Small elevation changes suggested BM datum was stable during that period.
(c) Both HP and TP elevations rose about 0.2ft in 2007 from the initial 2005 survey.
Not able to determine the cause to the elevation change from the level loop results.
(d) The relatively large pin elevation change suggested the WSEs of 2007 survey may not reference to the same datum initially set up on 7/21/05.
Therefore, the 2007 hydraulics were not used in modeling.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/21/2005	96.35
8/17/2005	96.39
9/9/2005	96.60
6/29/2006	96.35
7/9/2006	96.34
4/14/2007	96.34

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/21/2005	
8/17/2005	35.3
9/9/2005	63.7
6/29/2006	
7/9/2006	27.9
4/14/2007	25.9

No flows were measured on 7/21/05 and 6/29/06

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/21/2005	2.088%	109.2
8/17/2005	1.872%	94.0
9/9/2005	2.120%	104.7
6/29/2006	2.025%	94.3
7/9/2006	1.908%	84.9
4/14/2007	1.994%	136.9

The slope S=1.872% of 8/17/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/21/2005	95.27
8/17/2005	95.69
9/9/2005	95.70
6/29/2006	95.34
7/9/2006	95.74
4/14/2007	95.24
max Invert	95.74
SZF	93.99

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Inverts of 7/21/05 and 6/29/06 surveys were not used to determine SZF because no flows were measured
(4) Invert of 4/10/07 survey was not used to determine SZF because of possible disturbance to the BM datum

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1	7/21/2005		96.35			
2	8/17/2005	35.3	96.39	96.40	0.01	IFG4
3	9/9/2005	63.7	96.60	96.59	-0.01	IFG4
4	6/29/2006		96.35			
5	7/9/2006	27.9	96.34	96.34	0.00	IFG4
6	4/14/2007	25.9	96.34			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) No flows were measured during the 7/21/05 and 6/29/06 site visits.
(d) Hydraulics of 4/14/07 were affected by possible BM datum shift, and thus were not used for modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 27.9cfs, 35.3cfs, and 63.7cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/21/2005		
8/17/2005	35.3	Y
9/9/2005	63.7	Y
6/29/2006		
7/9/2006	27.9	Y
4/14/2007	25.9	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

Stream: Upper Talarik Creek Tributary 1.190

Reach: UT-1.190 (UT-C)

Site/TR: 05UT190-RF3

Habitat Type: Riffle

River Kilometer: 0.91

Stream: **Upper Talarik Creek Tributary 1.190**
Reach: **Trib 190**
Site: **05UT190-RF3**
Habitat Type: **Riffle**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/22/2005	100.00	98.63	99.82
2nd	8/17/2005	100.00	98.61	99.81
3rd	9/9/2005	100.00	98.62	99.81
4th	7/8/2006	100.00	98.60	99.81
5th	4/14/2007	100.00	98.55	99.82

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative pin elevations changes between BM and TP were within 0.01ft from 2005 to 2007. Small elevation changes suggested BM datum was stable during the 2-year period.
(c) It appeared HP was slightly unstable as it continued to sink, relative to both BM and TP. No corrections for the WSEs were needed because the BM datum was stable.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/22/2005	96.87
8/17/2005	96.86
9/9/2005	97.14
7/8/2006	96.74
4/14/2007	96.77

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/22/2005	
8/17/2005	32.8
9/9/2005	59.3
7/8/2006	26.1
4/14/2007	27.8

No discharge was measured on 7/22/05 when substrate was surveyed

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/22/2005	2.119%	68.9
8/17/2005	1.897%	48.5
9/9/2005	2.065%	58.6
7/8/2006	2.000%	44.0
4/14/2007	2.163%	68.9

The slope S=1.897% of 8/17/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/22/2005	95.85
8/17/2005	95.86
9/9/2005	95.94
7/8/2006	95.84
4/14/2007	95.97
max Invert	95.97
SZF	95.97

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Invert of 7/22/05 survey was not used to determine SZF because no flow was measured

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

8/8/2008 Initial WSE calibration using IFG4 showed Froude numbers decreasing with increasing flows.
Changed calibration method to MANSQ and the results became reasonable for all hydraulic parameters.

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	7/22/2005		96.87			
2nd	8/17/2005	32.8	96.86	96.86	0.00	MANSQ
3rd	9/9/2005	59.3	97.14	97.11	-0.03	MANSQ
4th	7/8/2006	26.1	96.74	96.78	0.04	MANSQ
5th	4/14/2007	27.8	96.77	96.80	0.03	

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.04ft is within acceptable range
(c) No flow was measured during the 7/22/05 site visit.
(d) Photos of 4/14/07 site visit showed only residual snow on the ground.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 26.1cfs, 27.8cfs, 32.8cfs, and 59.3cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/22/2005		
8/17/2005	32.8	Y
9/9/2005	59.3	Y
7/8/2006	26.1	Y
4/14/2007	27.8	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow. The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.

MANSQ Data Deck

Stream: Upper Talarik Creek Tributary 1.190

Reach: UT-1.190 (UT-C)

Site/TR: 05UT190-RF4

Habitat Type: Riffle

River Kilometer: 1.12

Stream: **Upper Talarik Creek Tributary 1.190**
Reach: **Trib 190**
Site: **05UT190-RF4**
Habitat Type: **Riffle**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/22/2005	100.00	99.14	99.65
2nd	8/17/2005	100.00	99.13	99.64
3rd	9/9/2005	100.00	99.13	99.65
4th	7/9/2006	100.00	99.15	99.66
5th	4/14/2007	100.00	99.15	99.67

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative pin elevations changes between BM and HP were within ±0.01ft from 2005 to 2007.
Small elevation changes suggested survey datum was stable during the 2-year period.
(c) It appeared TP was also stable with no more than 0.02ft of change relative to BM datum

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/22/2005	96.49
8/17/2005	96.47
9/9/2005	96.77
7/9/2006	96.47
4/14/2007	96.42

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/22/2005	
8/17/2005	31.8
9/9/2005	64.8
7/9/2006	29.1
4/14/2007	24.9

No discharge was measured on 7/22/05.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/22/2005	1.860%	82.8
8/17/2005	1.751%	73.1
9/9/2005	1.801%	78.3
7/9/2006	1.618%	76.0
4/14/2007	1.812%	82.8

The slope S=1.751% of 8/17/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/22/2005	95.52
8/17/2005	95.57
9/9/2005	95.47
7/9/2006	95.37
4/14/2007	95.62
max Invert	95.62
SZF	95.92

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Invert of 7/22/05 survey was not used to determine SZF because no flow was measured

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	7/22/2005		96.49			
2nd	8/17/2005	31.8	96.47	96.49	0.02	IFG4
3rd	9/9/2005	64.8	96.77	96.77	0.00	IFG4
4th	7/9/2006	29.1	96.47	96.46	-0.01	IFG4
5th	4/14/2007	24.9	96.42	96.42	0.00	IFG4

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.02ft is within acceptable range
(c) No flow was measured during the 7/22/05 site visit.
(d) Photos of 4/14/07 site visit showed only residual snow on the ground with no contact with water.
Did not expect hydraulics were affected by the residual ice.

calibration notes

(3) Velocity calibration

This site has one transect with four complete velocity/discharge measurements, including 24.9cfs, 29.1cfs, 31.8cfs, and 64.8cfs. Each of the four measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/22/2005		
8/17/2005	31.8	Y
9/9/2005	64.8	Y
7/9/2006	29.1	Y
4/14/2007	24.9	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.
Froude numbers at higher flows were near- or super-critical, which may be due to either or both of the two following reasons: (a) This section of stream was very steep with an average WSE slope of 1.75%, and/or (b) There was a small floodplain on the left side of the channel. When flow level reached the floodplain, the hydraulic depth abruptly decreased, causing the Froude number (see definition below) to significantly increase.

IFG4 Data Deck

Stream: Upper Talarik Creek Tributary 1.190

Reach: UT-1.190 (UT-C)

Site/TR: 05UT190-RN1

Habitat Type: Run

River Kilometer: 1.35

Stream: **Upper Talarik Creek Tributary 1.190**
Reach: **Trib 190**
Site: **05UT190-RN1**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/22/2005	100.00	99.17	99.32
2nd	8/17/2005	100.00	99.18	99.32
3rd	9/9/2005	100.00	99.19	99.33
4th	7/8/2006	100.00	99.22	99.36
5th	4/14/2007	100.00	99.24	99.29

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative pin elevations changes between BM and HP or TP were within 0.02ft in 2005. Small elevation changes suggested the survey datum was stable during the period.
(c) TP and HP rose 0.04ft to 0.05ft, respectively, in 2006 from the initial elevation. Consistent pin elevation change suggested BM datum may have been lowered by the same amount. Therefore, the HI for 2006 elevation survey was reduced by 0.04ft to correct to the elevations referenced to the initial datum set up on 7/22/05.
(c) HP and TP moved again in the 2007 survey with inconsistent amount from their 2006 elevations. Not able to determine which pin(s) moved, and, therefore, the 2007 hydraulics data were not used for modeling.

calibration notes

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/22/2005	97.01
8/17/2005	97.06
9/9/2005	97.31
7/8/2006	96.98
4/14/2007	96.83

WSE of 2006 has reflected the 0.04 correction.

Control pins were disturbed in the 2007 survey. WSEs were not included in modeling.

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/22/2005	
8/17/2005	27.3
9/9/2005	56.1
7/8/2006	24.8
4/14/2007	23.7

No discharge was measured on 7/22/05

calibration notes

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/22/2005	1.474%	56.3
8/17/2005	1.280%	45.3
9/9/2005	1.411%	49.6
7/8/2006	1.159%	49.2
4/14/2007	1.563%	56.3

The slope S=1.280% of 8/17/2005 survey was used for hydraulic modeling.

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/22/2005	95.84
8/17/2005	95.86
9/9/2005	95.91
7/8/2006	95.78
4/14/2007	95.83
max Invert	95.91
SZF	95.91

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Invert of 7/22/05 survey was not used to determine SZF because flow was not measured
(4) Invert of 4/14/07 survey was not used to determine SZF because pins were disturbed

calibration notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	7/22/2005		97.01			
2nd	8/17/2005	27.3	97.06	97.03	-0.03	IFG4
3rd	9/9/2005	56.1	97.31	97.31	0.00	IFG4
4th	7/8/2006	24.8	96.98	97.00	0.02	IFG4
5th	4/14/2007	23.7	96.83			

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.03ft is within acceptable range
(c) No flow was measured during the 7/22/05 site visit.
(d) Photos of 4/14/07 site visit showed only residual snow on the ground,
but the surveyed data were used for modeling because pins were disturbed.

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 24.8cfs, 27.3cfs, and 56.1cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/22/2005		
8/17/2005	27.3	Y
9/9/2005	56.1	Y
7/8/2006	24.8	Y
4/14/2007	23.7	

calibration notes

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.
Froude numbers at higher flows were near-critical. This was expected due to the steep WSE slope of nearly 1.3% in this section of the stream.

Stream: Upper Talarik Creek Tributary 1.190

Reach: UT-1.190 (UT-C)

Site/TR: 05UT190-RF5

Habitat Type: Riffle

River Kilometer: 2.48

Stream: Upper Talarik Creek Tributary 1.190
Reach: Trib 190
Site: 05UT190-RF5
Habitat Type: Riffle

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	7/22/2005	100.00	99.74	101.15
2nd	8/17/2005	100.00	99.74	101.16
3rd	9/9/2005	100.00	99.75	101.16
4th	7/9/2006	100.00	99.74	101.16
5th	4/14/2007	100.00	99.75	101.20

(a) Elevations of control pins (BM, HP, TP) are from the first half of each level loop survey.
(b) Relative pin elevations changes between BM and HP were within 0.01ft from 2005 to 2007. Small elevation changes suggested survey datum was stable during the 2-year period.
(c) HP rose 0.05ft in 2007 from the initial BM setup. No corrections for the WSEs were needed because the survey datum was stable through 2007.

Measured WSE:

There were three WSEs (Right, Mid, and Left) measured across the transect for each flow, and the average of the three was used as transect representative WSE for modeling.

Date	WSE (ft)
7/22/2005	98.59
8/17/2005	98.55
9/9/2005	98.85
7/9/2006	98.63
4/14/2007	98.60

calibration notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
7/22/2005	
8/17/2005	23.8
9/9/2005	40.4
7/9/2006	19.6
4/14/2007	18.2

No discharge was measured on 7/22/05.

Longitudinal WSE Slope:

Slopes were calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
7/22/2005	1.732%	45.6
8/17/2005	1.917%	48
9/9/2005	1.508%	35.8
7/9/2006	1.573%	33.7
4/14/2007	1.273%	55

The slope S=1.508% of 9/9/2005 survey was used for hydraulic modeling.

calibration notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
7/22/2005	97.74
8/17/2005	97.65
9/9/2005	97.65
7/9/2006	97.73
4/14/2007	97.80
max Invert	97.80
SZF	98.20

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) Invert of 7/22/05 survey was not used to determine SZF because no flow was measured.

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR1	Calibrated WSE(ft) TR1	WSE calibration error (ft) TR1	Calib. Method
1st	7/22/2005		98.59			
2nd	8/17/2005	23.8	98.55			
3rd	9/9/2005	40.4	98.85	98.85	0.00	IFG4
4th	7/9/2006	19.6	98.63	98.62	-0.01	IFG4
5th	4/14/2007	18.2	98.60	98.61	0.01	IFG4

Note: (a) WSE calibration error = Calibrated WSE - Measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range
(c) No flow was measured during the 7/22/05 site visit.
(d) Photos of 4/14/07 site visit showed only residual snow on the ground with no contact with water.
(e) Data collected on 8/27/05 was not included in modeling due to significant bathymetry change:
Bed profile comparison showed the last three measured transect profiles (9/9/05 and 2006 and 2007) were consistent while they each were about 0.2ft higher than the first two profiles collected ealier on 7/22/05 and 8/17/05. The bed profile change suggested the stream hydraulics have been significantly altered from 8/05 to 9/05. Hydraulics of 8/05 were not used in modeling.

calibration notes

(3) Velocity calibration

This site has one transect with three complete velocity/discharge measurements, including 18.2cfs, 19.6cfs, and 40.4cfs. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the three calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
7/22/2005		
8/17/2005	23.8	
9/9/2005	40.4	Y
7/9/2006	19.6	Y
4/14/2007	18.2	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulic parameters (Fr, V_ave, WSE, Manning's n, Wetted perimeter) were all within reasonable ranges and appeared to vary with normal trends.
Froude numbers at higher flows were near-critical. This was expected due to the steep WSE slope of 1.5% in this section of the stream.

Stream: **Koktuli River**
Site: **04-MSK-RF2**
Habitat Type: **Riffle**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1	6/28/2005	100.00	99.66	98.71
2	7/18/2005	100.00	99.67	98.72
3	8/12/2005	100.00	99.65	98.71
4	7/25/2006	100.00	99.73	98.77
5	8/10/2006	100.00	99.71	98.77

(a) Elevation of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevation changes between control pins were within ± 0.01ft in 2005 and in 2006.
(c) Both HP and TP changed (increased) 0.06ft when compared to BM, which may be the results of BM being moved lower 0.06ft in 2006. Therefore, the WSE surveyed in 2006 was artificially raised by 0.06ft to compensate for the BM elevation change.
(d) HP and TP were stable for their consistent difference in elevation over time

Measured WSE:

There are three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/28/2005	95.85
7/18/2005	95.83
8/12/2005	95.45
7/25/2006	95.72
8/10/2006	95.67

The 2006 WSEs shown above have reflected the 0.06ft elevation adjustmentfor BM disturbance.

Calibration Notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/28/2005	541.6
7/18/2005	
8/12/2005	354.3
7/25/2006	482.5
8/10/2006	

(a) No discharge was measured during the 7/18/05 site visit
(b) No discharge was measured during the 8/10/06 site visit

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/28/2005	0.084%	119.1
7/18/2005	0.196%	352
8/12/2005	0.065%	323.2
7/25/2006	0.039%	170
8/10/2006	0.030%	164.20

The slope S=0.084% of 6/28/05 survey was used for hydraulic modeling.

Calibration Notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/28/2005	93.45
7/18/2005	
8/12/2005	93.35
7/25/2006	93.62
8/10/2006	
Invert	93.62
SZF	93.62

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profiles were surveyed on 7/18/05 and 8/10/06

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft)	Calibrated WSE(ft)	WSE calibration error (ft)	Calib. Method
			TR	TR	TR	
1	6/28/2005	541.6	95.85	95.84	-0.01	IFG4
2	7/18/2005		95.83			
3	8/12/2005	354.3	95.45	95.45	0.00	IFG4
4	7/25/2006	482.5	95.72	95.73	0.01	IFG4
5	8/10/2006		95.67			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) 7/18/05 and 8/10/06 data sets are not included in modeling because of no flows measured

Calibration Notes

(3) Velocity calibration

This site has one transect with three velocity/discharge measurements, ranging from 354.3cfs to 541.6cfs.
Each of the three measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocity was greatly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge.
The adjusted Manning's n are summarized in the NS lines of the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/28/2005	541.6	Y
7/18/2005		
8/12/2005	354.3	Y
7/25/2006	482.5	
8/10/2006		

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges.
Manning's n and Fr decreases both stay virtually flat through the entire range of simulation flows.

IFG4 Data Deck

Stream: Koktuli River

Reach: Koktuli River

Site/TR: 04-MSK-IC2

Habitat Type: Island Complex

River Kilometer: 25.37

Stream: **Koktuli River**
Site Identifier: **04-MSK-IC2**
Habitat Type: **Island Complex**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	6/28/2005	100.00	99.58	97.73
2nd	7/18/2005	100.00	99.56	97.71
3rd	8/12/2005	100.00	99.55	97.71
4th	7/25/2006	100.00	99.57	97.72
5th	4/15/2007	100.00	99.59	97.76

(a) Elevations of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevation changes between control pins were within ±0.02ft from Year 2005 to Year 2006.
(c) The relatively small elevation changes suggested the control pins were stable over the period from 2005 to 2006.
(d) Year 2007 survey may be affected by frost heave and the data were not used.

Measured WSE:

There are three WSEs (Right, mid, and Left) measured across each of LC and RC of each flow, and the average of the three is used as transect representative WSE for modeling.

	WSE (ft)	
Date	Left (main)	Right
6/28/2005	95.23	94.82
7/18/2005	95.11	94.82
8/12/2005	94.82	94.54
7/25/2006	95.03	94.64
4/15/2007	95.19	94.99

WSEs of left channel were used in hydraulic modeling because most water flowed through the left channel.

Calibration Notes

Discharge:

All measured discharges are listed in the following table.

Date	Flow (cfs)		
	Left (main)	Right	Total
6/28/2005	431.9	125.7	557.6
7/18/2005			
8/12/2005	250.1	92.5	342.6
7/25/2006	360.2	139.3	499.5
4/15/2007	369.8	114.6	484.5

Left channel is designated as main channel because it carries more water than the right channel

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream on each side of the channel in the vicinity of the transect.

Left (Main) Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/28/2005	0.075%	160.5
7/18/2005	0.066%	228
8/12/2005	0.035%	228
7/25/2006	0.063%	206.5
4/15/2007	0.055%	200

The slope S=0.075% surveyed on 6/28/05 was used for hydraulic modeling.

Right Channel

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/28/2005		
7/18/2005	0.174%	149
8/12/2005	0.262%	149
7/25/2006	0.225%	111
4/15/2007	0.264%	170.6

Left channel WSE Slope of 6/28/05 is used in hydraulic modeling

Calibration Notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/28/2005	91.83
7/18/2005	
8/12/2005	91.62
7/25/2006	91.93
4/15/2007	91.69
Invert	91.93
SZF	91.93

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/18/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR-1	Calibrated WSE(ft) TR-1	WSE calibration error (ft) TR-1	Calib. Method
1st	6/28/2005	557.6	95.23	95.19	-0.04	IFG4
2nd	7/18/2005		95.11			
3rd	8/12/2005	342.6	94.82	94.79	-0.03	IFG4
4th	7/25/2006	499.5	95.03	95.10	0.07	IFG4
5th	4/15/2007	484.5	95.19			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.07ft is within acceptable range for a complex channel.
(c) No discharge was surveyed on 7/18/05
(d) 4/15/07: Photos showed bank was covered by snow/ice and ice collapsed and fell in the channel that would affect the hydraulics. Also the transect profile showed left side of the channel was shifted about 10ft to the right that may the result of ice formation near shore. Therefore, the surveyed results won't be used for modeling.

Calibration Notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 342.6cfs to 557.6cfs. The flow profile surveyed in 2007 would not be included for hydraulic modeling due to ice impact. Therefore, there are only three velocity profiles available for hydraulic modeling. Each of the three measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. The adjustment of n values was made at the stations where simulated velocities were significantly different from the measured values or unreasonably over/under-estimated by the model, particularly near the waters edge. The adjusted Manning's n values are summarized in the NS lines in the IFG4 data decks.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/28/2005	557.6	Y
7/18/2005		
8/12/2005	342.6	Y
7/25/2006	499.5	
4/15/2007	484.5	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges with normal trends.

IFG4 Data Deck

Stream: Koktuli River

Reach: Koktuli River

Site/TR: 04-MSK-RF1

Habitat Type: Riffle

River Kilometer: 31.98

Stream **Koktuli River**
Site: **04-MSK-RF1**
Habitat Type: **Riffle**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1st	6/27/2005	100.00	100.13	100.15
2nd	7/23/2005	100.00	100.15	100.12
3rd	8/18/2005	100.00	100.13	100.15

(a) Elevation of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevation changes between control pins were within ± 0.01ft.
(c) The small elevation changes indicate the control pins were stable during the survey period.

Meaured WSE:

There are multiple WSEs measured across the transect for each flow. The average WSE on the left side of the channel (i.e., main channel) is used as transect representative WSE for modeling.

Date	WSE (ft)
6/27/2005	96.52
7/23/2005	96.05
8/18/2005	95.85

WSEs above are the water surface elevations of the main channel where most water flows through.

Calibration Notes

Discharge:

All the measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/27/2005	494.3
7/23/2005	
8/18/2005	339.7

(1) No discharge was measured during the 7/23/05 survey

(2) The discharge is the total flow of the entire transect, including main (left), center and right channels. Main (left) channel contains the majority of flow.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/27/2005	0.411%	214.1
7/23/2005	0.486%	214
8/18/2005	0.449%	225

The slope S=0.411% of 6/27/05 survey was used for hydraulic modeling.

Calibration Notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/27/2005	92.62
7/23/2005	
8/18/2005	92.45
Invert	92.62
SZF	92.62

(1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/23/05

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1st	6/27/2005	494.3	96.52	96.50	-0.01	MANSQ
2nd	7/23/2005		96.05			
3rd	8/18/2005	339.7	95.85	95.85	0.00	MANSQ

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.01ft is within acceptable range.
(c) No discharge was measured during the 7/23/05 survey
(d) MANSQ was used for calibration because this transect has ony two pairs of WSE~Q.
Coefficient β=-1.0 was used, and the results are listed as follows.

Calibration Notes

1100	97.03
1150	97.06
1200	97.10

Calibration Notes

(3) Velocity calibration

This site has one transect with two velocity/discharge measurements at Q= 339.7cfs and 494.3cfs.
Each of the two measured velocity profiles was used as template for velocity calibration.
Simulated velocity profile of each measured flow was calibrated to resemble its measured profile
by slightly adjusting the Manning's n values given by IFG4 model. Then the calibrated velocity profile
was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the two
calibrated velocity profiles of this transect, no adjustments for the model-calculated n values were needed.

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/27/2005	494.3	Y
7/23/2005		
8/18/2005	339.7	Y

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within
reasonable ranges. The parameters have normal trends at Q>500cfs.
Manning's n increases and Fr decreases with increasing flows at lower simulation flow range below 500cfs.
This is expected because it is caused by the plateau at Elv~96ft between Sta=40 and Sta=85 when water
levels are in the vicinity of the plateau elevation.

MANSQ Data Deck

Stream: Koktuli River

Reach: Koktuli River

Site/TR: 04-MSK-RN3

Habitat Type: Run

River Kilometer: 43.96

Stream: **Koktuli River**
Site: **04-MSK-RN3**
Habitat Type: **Run**

(1) Field Data

Level Loop Surveys:

Flow	Date	BM	HP	TP
1	6/28/2005	100.00	99.62	98.13
2	7/18/2005	100.00	99.63	98.14
3	8/12/2005	100.00	99.62	98.12
4	7/5/2006	100.00	99.63	98.16
5	4/15/2007	100.00	99.63	98.30

(a) Elevation of control pins (BM, HP, TP) are taken from the first half of each level loop survey
(b) Relative elevations between BM and HP were no more than 0.01ft, indicating the control pins were stable during the 2005-2007 period.
(b) TP of April 07 may have moved slightly, but the hydraulics of this date was not used in hydraulic calibration due to ice near shore and possibly frost heave.

Measured WSE:

There are three WSEs (Right, mid, and Left) measured across the transect for each flow, and the average of the three is used as transect representative WSE for modeling.

Date	WSE (ft)
6/28/2005	94.75
7/18/2005	94.62
8/12/2005	94.22
7/5/2006	94.45
4/15/2007	94.19

Calibration Notes

Discharge:

All measured discharges are listed in the following table.

Date	Ave Q (cfs)
6/28/2005	449.7
7/18/2005	
8/12/2005	282.7
7/5/2006	429.8
4/15/2007	340.6

No discharge was measured on 7/18/05.

Longitudinal WSE Slope:

Slopes are calculated using the WSEs and longitudinal distances measured along the stream in the vicinity of the transect.

Date	WSE Slope (%)	WSE Slope Distance (ft)
6/28/2005	0.138%	115.7
7/18/2005	0.159%	232.6
8/12/2005	0.238%	239.6
7/5/2006	0.164%	261.5
4/15/2007	0.270%	126.0

The slope S=0.238% of 6/28/05 survey was used for hydraulic modeling.

Calibration Notes

SZF (Stage of Zero Flow):

Date	Transect Invert (ft)
6/28/2005	92.65
7/18/2005	
8/12/2005	92.52
7/5/2006	92.55
4/15/2007	92.34
Invert	92.65
SZF	92.65

Note: (1) Transect invert is the lowest elevation of the cross-section
(2) SZF is the theoretical stage of zero flow determined from the WSE calibration process
(3) No transect profile was surveyed on 7/18/05

Calibration Notes

(2) WSE Calibration:

Model: PHABSIM ver 2.1 July, 1989

WSE Calibration Results:

Flow	Survey Date	Q (cfs)	Measured WSE(ft) TR	Calibrated WSE(ft) TR	WSE calibration error (ft) TR	Calib. Method
1	6/28/2005	449.7	94.75			
2	7/18/2005		94.62			
3	8/12/2005	282.7	94.22	94.22	0.00	MANSQ
4	7/5/2006	429.8	94.45	94.46	0.01	MANSQ
5	4/15/2007	340.6	94.19			

Note: (a) WSE calibration error = calibrated WSE - measured WSE
(b) Maximum WSE calibration error 0.00ft is within acceptable range.
(c) 6/28/05 data was not included for calibration because of suspicious WSE, which was too high compared to the WSE of 7/5/06 which had a similar flow.
(d) 7/18/05 data set has no measured discharge
(e) 4/6/07 data set was not included in calibration due to ice effect

8/7/08: Initial WSE calibration using three flows (6/28/05, 8/12/05, and 7/5/06) shows Fr decreases with increasing flows. After examining the measured Q ~ WSE relationship, it is determined the unreasonable hydraulics may be caused by the 6/28/05 hydraulics. Therefore, only 8/12/05 and 7/5/06 hydraulics are used for modeling using MANSQ to calibrate the WSE.
Coefficient β=-0.4 was used and the simulation results for are listed in the following table.

Calibration Notes

1100	95.22

Calibration Notes

(3) Velocity calibration

This site has one transect with four velocity/discharge measurements, ranging from 282.7cfs to 449.7cfs. The hydraulics of 6/06 was not included in hydraulic modeling due to inconsistent WSE~Q relationship. The hydraulics of 4/07 was not included in hydraulic modeling due to ice impact. Therefore, there are only two complete velocity profiles available for hydraulic modeling. Each of the two measured velocity profiles was used as template for velocity calibration. Simulated velocity profile of each measured flow was calibrated to resemble its measured profile by slightly adjusting the Manning's n values given by IFG4 model, if needed. Then the calibrated velocity profile was used to simulate velocity for a range of flows in the vicinity of the measured flow. For the two calibrated velocity profiles of this transect, no adjustment for n values was needed

A Y in the following table calibrates the calibrated velocity profile was used in habitat (WUA) modeling.

Survey Date	Q (cfs)	WUA (Y/N)
6/28/2005	449.7	
7/18/2005		
8/12/2005	282.7	Y
7/5/2006	429.8	Y
4/15/2007	340.6	

(4) Hydraulic Calibration Results:

Hydraulic simulation results are summarized in the tables and figures that follow.
The results show the simulated hydraulics (Fr, V_ave, WSE, Manning's n, Wetted perimeter) are all within reasonable ranges with normal trends.

Transect Photographs

Transect Photographs

The photographs in this document show each of the PHABSIM (physical habitat simulation software computer model) transects throughout the Pebble Project study area at varying flows. The study area included the following basins: NorthFork Koktuli (NFK), South Fork Koktuli (SFK), Upper Talarik Creek (UT) and Mainstem Koktuli River (KR). Each page of photographs represents a single transect, whether that transect constitutes an entire site (e.g., 05-NFK1-RN1) or a section of a site (e.g., the left channel in 05-NFK1-IC3; the right channel of Transect 2 in 08-NFK1-MS2). The heading on each page identifies the location of the transect in the subbasin and reach, as well as the site name and the direction of view (e.g., looking downstream). Photographs are organized from the downstream-most site to the upstream-most site in each basin.

Most transects are represented by three views. Photographs are not available for every site visit; thus, some transects are represented by two views. Photographs are not arranged chronologically on the page. The highest recorded flow is represented by the left photograph, with lower flows presented in the center and to the right regardless of date. Each photograph is labeled with the date that the photograph was taken and the recorded flow (in cfs) on that date, unless otherwise noted. In a few situations, the date of the photograph differs by a few days from the date of the recorded flow.

Under certain circumstances, a flow value is not identified for a photograph. In these cases, the photograph shown is from a site visit for which no flow measurement was taken. This occurred during the July 2005 site visits, when only substrate measurements were collected, and during some of the April 2007 site visits, when ice conditions prevented the collection of flow data. Two other instances of unrecorded flow are: the August 10, 2005 site visit to 05-SFK3-RN1 when conditions were too shallow to measure velocity, and an aerial photograph of 04-UTC-IC2 on September 10, 2005 used to represent the highest flow. These photographs are included here to present a visual depiction of the site at three flows, whenever possible.

For each Island Complex (IC) site and each 2008 R2 site, a single flow value is used for all photographs of the site on a specific date; this represents the overall measured flow through multiple channels (and transects in the R2 sites). Hence, photographs of left and right channels that depict clearly different discharge are shown to have the same flow. The sole exception to this arrangement is 08-NFK2-MS1, Transect 1, which lies far enough downstream from Transect 2 to be considered separately from Transects 2 and 3 due to additional intervening flow.

OFF-CHANNEL HABITAT

1. INTRODUCTION

An instream flow habitat study was initiated in 2004 as part of the environmental baseline studies associated with the Pebble Project. Primary components of the instream flow habitat study include characteristics of flow to main-channel and off-channel habitats; availability of suitable spawning, rearing, and refuge habitats; surface water temperature; and fluvial geomorphology. This report describes the results of the off-channel habitat study, specifically focusing on the North Fork Koktuli River (NFK), South Fork Koktuli River (SFK) and Upper Talarik Creek (UT). The results of the main channel instream flow incremental methodology study and temperature monitoring/modeling components of the instream flow habitat study, respectively, are provided in Appendix 15.1C and Appendix 15.1D to Section 15.1 of the environmental baseline document for the Pebble Project (EBD).

The overall goal of the off-channel habitat study was to assess potential fish habitat provided by off-channel habitats (OCHs) located in the floodplain of the active valleys of the NFK, SFK, and UT. The active valley, as defined here, includes the mainstem channel and adjacent floodplain. A schematic of an active river valley is depicted in Figure 1. This report focuses on: (1) the distribution, physical characteristics, and connectivity of OCHs located within the active valley of all three rivers, and (2) fish utilization of OCHs.

1.1 Physiography and Planform

The NFK, SFK, and UT flow through Pleistocene era, glacially formed valley bottoms overlain with Holocene alluvial sediments (Hamilton, 2007; Detterman and Reed, 1973). The mainstem channels of all three rivers were set within floodplains composed of wetland shrub thickets, wet meadows and, in some reaches of UT, riparian forests. Interspersed throughout the floodplain of these rivers was an extensive network of OCHs. The complex of alluvial, glacial fluvial, glacial lacustrine, and colluvial deposits in these valleys has created a diverse hydrogeologic landscape wherein groundwater inflows support a variety of surficial waterbodies including: alcoves, side channels, beaver ponds (also referred to as beaver complexes), beaver pond outlet channels, percolation channels, and isolated ponds. Formal definitions of these waterbody types are presented in Section 2.2.

All three rivers were composed of pool-riffle and plane bed, gravel bedded channels (Appendix 15.1F; Montgomery and Buffington, 1997). Channel gradients were very low and ranged from 0 percent where the river flowed through lacustrine surficial deposits in the SFK, to steeper bedrock controlled channel reaches of UT, averaging a 0.5 percent gradient (R2, 2010). Low gradient (0 percent), relatively unconfined valley sites such as the NFK below Tributary NFK 1.190, were areas of high beaver activity where relic side and percolation channels are dammed—creating large beaver ponds within the wide active valley. More highly confined reaches, such as those of upper reaches of the UT, had less active valley area and, therefore, fewer OCH complexes.

Both braided and meandering channel planforms are found in the study area (Appendix 15.1F). The NFK and UT tend toward a braided planform (Photo 1), while much of the SFK and the headwater areas of all three rivers tend towards a meandering planform (Photo 2). The level of meandering found was associated with the degree of channel confinement, with less confined broader active valley areas having a more meandering form. This characterization was consistent with data on channel forming flows, channel slope data, and slope:discharge relationships in the study area, as well as from the literature (Leopold et al., 1995). Over time, meandering channel planforms generate cut-off-channels, ox bows, and other abandoned main stem floodplain channel features (Photo 1) that often are subsequently dammed by beavers—forming ponds.

1.2 Overview of OCH Formation and Fish Habitat Function

OCHs, as defined in this study, are specific habitat types located within a river's active valley but outside the mainstem channel. OCHs in glaciated river valleys are created by the interaction of channel processes, ground and surface water, vegetation, and beaver activity. The continuous interaction of all of these elements, especially channel migration and beaver activity, results in a dynamic floodplain environment within which OCHs are continually being created and destroyed. The locations (connections with mainstem rivers), morphologies (typically slow moving, relatively deep water), and complexities (often contain a mix of woody debris and aquatic vegetation) of many types of OCHs make them especially attractive as refuge and rearing habitats for juvenile salmonids. For example, sampling of a 20-kilometer reach of the Hoh River in the Olympic Peninsula of Washington found that nearly all rearing of salmonid fish occurred in off-channel areas and tributaries. Densities of salmonids in off-channel areas averaged 0.364 fish per 1 square meter (m^2), but only 0.004 fish/m^2 in the mainstem portions of the river (Sedell et al., 1980).

Channel migration leaves behind ponds and sloughs with varying depths and degrees of hydrologic connectivity to the mainstem. Channel migration may result from gradual annual movement or through channel avulsion processes driven by flow obstructions such as ice dams or large woody debris. Within the study area, ice dams likely play a larger role in channel migration than large woody debris, because little large woody debris was documented during baseline habitat surveys. The results of channel migration activity were abandoned, curved channels that can be seen throughout the floodplains of all three rivers (Figures 2, 3, 4a, 4b, and 5; Photo 1). These abandoned channels provide a framework for beaver activity and development of future OCH.

Ground and surface water both contribute to the generation and maintenance of OCHs (Gurnell, 1998; Pollock et al., 2003). Flowing surface water acts as an erosive agent, as well as an agent to transport the sediment that forms alluvial terrain features. Groundwater within these systems appears to be important to the generation and maintenance of OCHs and may also affect their potential to function as high quality fish habitat. Groundwater-controlled OCHs include isolated ponds, percolation channels, and beaver ponds. These OCHs contain water year-round and under varying flow conditions; they also may provide a continuous source of water to mainstem habitats. Surface water connectivity between OCHs and the mainstem is the critical element in providing fish access from the mainstem to and from off-channel habitat (Pollock et al., 2004).

Riparian vegetation provides root cohesion and shear resistance to unconsolidated alluvial sediments found in active valleys of glaciated terrain (Naiman et al., 2005). The dominant plants within the study

area were shrubs, herbs, and grasses, although some riparian forest was found in reaches of Upper Talarik Creek. Willow shrubs serve as a primary structural element utilized by beavers to build their dams.

Beavers construct dams from woody stems, herbaceous vegetation, mud, and rocks. Small diameter stems are cut by beavers and strategically placed in mud, forming the dam's skeletal structure. The willow stems generally resprout into new shrubs providing further root cohesion to the dam and trapping sediment that further stabilizes the structure and serves as a site for additional plant colonization (Photographs 3 and 4; Muller-Schwarze and Sun, 2003).

Beavers generate and maintain OCHs by building dams across floodplain channels resulting in formation of ponds upstream of the dam (Photograph 5). Beaver dams and ponds can effectively control primary geomorphologic and ecological processes across an entire active valley (McDowell and Naiman, 1986; Pollock et al., 2003; Pollock et al., 2004). Beaver ponds generally have large edge-to-surface area ratios and slow velocity currents. This provides an extensive area for both emergent and scrub shrub wetland vegetation and aquatic invertebrates, resulting in ideal foraging opportunities for fish (Pollock et al., 2004).

Beaver ponds have been demonstrated to provide important habitat for many fish species, including salmonids, especially in streams lacking deep pools (Cunjack, 1996; Pollock et al., 2003). In Oregon and Washington, beaver ponds have been found to provide critical juvenile coho salmon (*Oncorhynchus kisutch*) habitat, especially during winter months (Pollock et al., 2003; Nickelson et al., 1992). In summer in southeast Alaska, impounded streams were found to support larger populations of coho juveniles than non-impounded stream reaches (Bryant, 1983). At the watershed scale, beaver ponds provide slow-water habitat favorable to rearing juvenile coho salmon and have been found to be of great importance for juvenile coho salmon production. Furthermore, the historic loss of this habitat, due to beaver removal, was found to be the single-most important factor currently limiting coho salmon production in the Stillaguamish River basin in Washington State (Pollock et al., 2004).

2. STUDY OBJECTIVES

Although substantial information exists indicating that off-channel habitat areas are often extensively used for rearing by juvenile salmonids (Pollock et al., 2004), the extent to which this occurs in areas present within the NFK, SFK, and UT watersheds is unknown. Therefore, the off-channel studies focused on off-channel habitat structure and function and fish use of these areas.

The primary objectives of the off-channel fish sampling were to:

- Collect and evaluate fish distribution and abundance data from representative off-channel habitat types within the NFK, SFK, and UT watersheds.
- Compare distribution and abundance data and determine whether off-channel habitat use varies by species, habitat type, and watershed.

The results of this analysis will be used to evaluate the biological significance of the off-channel habitat areas, as well as to define the current locations and areal extents of such areas within the three watersheds.

In support of the fish sampling design, off-channel habitat structure and function were assessed. The primary objectives of the off-channel habitat assessments were to:

- Identify processes responsible for OCH development and maintenance within the NFK, SFK, and UT.
- Characterize the quality and quantity of aquatic habitats within representative off-channel areas adjacent to mainstem rivers.
- Understand OCH hydrologic function relative to mainstem flow patterns.
- Evaluate mechanisms of OCH connectivity with mainstem channels.

3. STUDY AREA

Off-channel habitat is found through the active floodplain of three watersheds in the vicinity of the Pebble Deposit. The study area specific to the off-channel habitat study included the full length of the mainstem portions of the North and South Fork Koktuli rivers and Upper Talarik Creek . Furthermore, within each watersheds areas of concentrated OCHs were selected as intensive study areas where actual field work occurred. There was one intensive study area in the NFK, one in the SFK, and three in the UT (Figure 2).

4. SCOPE OF WORK

The off-channel habitat instream flow study was initiated in September 2005 by HDR Inc. with the establishment of off-channel habitat transects at an intensive study area in the SFK (Figure 3). Transects were positioned in proximity to, or co-located with, main channel instream flow transects to provide analysis of hydrologic linkages between main channel and off-channel sites. Transect surveys were intended to identify off-channel site features and describe fish habitat conditions and water surface elevations relative to the mainstem. In 2007, HDR Inc. expanded the study to include three intensive study areas in the UT (Figures 4a and 4b). The study was further expanded in 2008 by R2 Resource Consultants (R2), with the establishment of transects within one intensive study area in the NFK (Figure 5). All OCHs located within each intensive study area were typed and mapped using geographic information system (GIS)-based analysis of aerial photography. Using data collected from 2005 through 2008, R2 also developed an OCH classification system based on information about OCH structure, hydrologic connectivity with mainstem, and formative processes.

In addition to the 2008 transect surveys in the NFK, R2 installed pressure transducers in selected channel areas to record water surface elevation fluctuations at hourly intervals. Inlet connectivity surveys also were conducted in 2008 to estimate the flows (stage and discharge) at which the mainstem NFK hydrologically connects with off-channel waterbodies. Detailed study methodologies for each study element are provided below.

5. METHODS

5.1 OCH Topography and Water Surface Elevation

Intensive study sites were selected in each basin within off-channel habitat areas that supported a high density of OCHs. In the SFK, 15 transects were established within the intensive study area (Figure 3). Eleven of the 15 transects were co-located with main channel instream flow transects to provide assessment of hydrologic linkages between main channel and off-channel sites. Sixteen transects adjacent to or between existing UT mainstem instream flow transects were established in three intensive study areas along the UT (Figures 4a and 4b). Six transects were established in one intensive study area in the NFK (Figure 5) and once again were co-located with mainstem instream flow transects. All OCH transects were established normal to the valley bottom and extended approximately 300 meters to either side of the main channel, or to a major break in slope associated with high terraces (over 3 meters) found adjacent to the stream channel.

A topographic survey of each valley bottom transect was conducted using real-time kinematic satellite navigation or more traditional methods involving a standard handheld global positioning system (GPS) unit, auto level, stadia rod, and measuring tape. Ground elevations were measured and recorded along the valley bottom portions of the transect lacking aquatic habitat. Main channel water surface elevations associated with each OCH transect were measured during each survey. At each OCH encountered, the water surface elevation at wetted edges was recorded, and channel bed elevation (and/or depth) was recorded such that the bottom profile of each waterbody could be determined.

Off-channel waterbodies were each assigned a unique identifier. In 2005, 2006, and 2007, OCHs were coded based on the: river name (SFK or UT), transect number, location of the waterbody relative to the mainstem (H=on right bank looking downstream; T=Left Bank looking downstream), and unit # (e.g., SF 5H C1, 5H C2 etc.). In 2008, OCHs were coded based on the transect number and alphabetically in the order each unit was encountered.

Physical and hydrologic data along each transect were collected at two or three different flow regimes. Data collection methodologies were designed such that valley bottom profiles could be mapped and variation in OCH water surface elevations could be linked to main channel flow conditions. The SFK transects were sampled in September 2005 and August 2006; UT transects were sampled in June and September 2007; and NFK transects were sampled in June, July, and August 2008.

For the SFK and UT transects, each OCH intersected by a transect was established as an OCH site and subsequently was sampled to collect habitat and fish data. The number of SFK and UT sites per transect varied from one to 10. Because of the more intensive habitat survey methods used in 2008, a subset of the intercepted NFK OCHs was selected for habitat and fish sampling. Each subset sampled included two or three OCH sites representative of the OCH types encountered for each NFK transect.

5.2 OCH Classification and Mapping

Following collection and preliminary review of field data, R2 delineated the area of the active valley bottom supporting OCHs for the entire length of the NFK, SFK, and UT using electronic digitization in an ArcView environment. Ortho-corrected aerial photographs flown in 2004 were used as the base map.

Photos were overlain by 5- to 10-foot (1.5- to 3-meter) topographic contours developed from a digital elevation model (DEM) created from the base photography. Areas supporting OCHs were identified based on:

- Elevation relative to the mainstem - land surface generally less than 5 feet (1.5 meters) higher than the mainstem.
- Visual observation of surface water in OCH features.
- Vegetation community characteristics.

All water features within the valley bottom (except for tributary channels) were assumed to represent potential OCH. Features exhibiting open surface water were delineated as polygons. Linear water features that were clearly linked to the mainstem or to other OCH units, but that were too narrow to depict as polygons, were mapped as linear features. Linear features were assumed to have a width of approximately 3.3 feet (1 meter), which was the minimum width that could clearly be identified as open water. GIS-shapefiles were created by digitizing all OCH features visible within each intensive study area.

OCHs associated with mainstem river channels within the study area were classified using a modified version of a system developed for glacially-influenced rivers in Washington State (Peterson and Reid, 1984). Modifications were developed specifically for this study to incorporate OCH habitat types observed in the tundra environment during data collection (i.e., isolated ponds, beaver ponds, and beaver pond outlet channels). OCH types assigned during the course of study are defined below, schematically illustrated on Figure 1 and examples are documented in Photos 5 through 9.

Six types of OCHs were defined and mapped in this study as follows:

- Alcove – backwater area with low or no water velocity that is connected to the mainstem at the downstream end only and surrounded on all other sides by terrestrial vegetation (Photo 6).
- Side channel – linear waterbody that is located within the floodplain and connected to the mainstem at both ends during summer baseflows and that transmits a small proportion of the mainstem discharge at all flow levels. Channels that transmit substantial amounts of the mainstem discharge at most flow levels are called secondary channels and are considered mainstem habitat types (Photo 7).
- Beaver pond – irregularly shaped waterbody that is formed by a water impoundment behind a beaver dam (Photo 5).
- Beaver pond outlet channels – linear waterbody that transmits outflow from beaver ponds to the mainstem, or to other beaver ponds (Photo 5).
- Percolation channels – groundwater-fed channels that discharge to the mainstem, but that have no defined inlet or inflow from the mainstem at discharges below bankfull (Photo 8).
- Isolated ponds – irregularly shaped surface water features with no discernable surface inlet or outlet flow path to the mainstem (Photo 9).

5.3 Estimation of Active Valley OCH Area: Scaling-up from Intensive Study Area to the River Segment

The area of OCH in each river active valley was estimated by scaling up from the OCH intensive study area results. The scaling procedure involved simply multiplying the total area of each river segment active valley (NFK, SFK, and UT) by the percentage of OCH found in each intensive study area. Limitations of this approach are that (1) the intensive study areas were subjectively selected to be representative of each river and (2) the total study area population of OCH was assumed to be uniform in composition relative to OCH areal cover. The scaling results are presented as a non-statistical estimation of the composition and abundance of OCH and are to be interpreted as a first order linear approximation.

5.4 OCH Characteristics: Substrate Size, and Water Quality

In addition to water surface elevations, substrate size (Table 1) and water quality were characterized and recorded for each OCH during the transect surveys. Water quality measurements included temperature, dissolved oxygen, and specific conductivity.

5.5 Water Surface Elevation Fluctuations

Solinst Levellogger Gold Pressure transducers were installed at six sites in the NFK intensive study area in 2008. Pressure transducers were programmed to record the depth of water above the transducer at hourly intervals, thus providing a continuous record of water surface elevation fluctuations. Transducer deployment sites were selected to include the mainstem NFK River and five of the six OCH types (alcove, side channel, beaver pond, percolation channel, and isolated pond). Side channels were omitted since they have a known and direct connection to mainstem flow. The expectation was that fluctuations in OCH water surface levels would be linked to water depth fluctuations in the mainstem, but would vary by OCH type. This was done to detect potential linkages in water surface elevation changes in the mainstem river with changes in water depths in different OCH types. One of the fundamental questions concerning off-channel habitat features is whether and to what extent they respond to changes in mainstem flows. This element of the study was designed to provide data to address that question.

5.6 Surface Connectivity

To obtain a greater understanding of relationships between main channel flow conditions and hydrologic connection with OCHs, researchers conducted a series of mainstem/OCH connectivity surveys between June and August 2008 in all intensive study areas (NFK, SFK, and UT). Potential inlets and outlets to the mainstem were identified using orthophotos and maps. A two-person field crew then walked the mainstem channel throughout each intensive study area, visiting potential inlet locations to confirm the presence or absence of a surface water connection, and to identify additional connections that were not observed during the remote mapping exercise. There was also a need to define the relationship between the mainstem water surface elevation and the bed elevation at the location of the inlet hydrologic control for each connected OCH. To accomplish this, the water surface and hydraulic control bed elevations (Figure 6) were measured using a real-time, kinematic differential GPS or an auto level and stadia rod.

One hundred eighty potential OCH inlets were identified on aerial photos prior to field work (19 in the NFK, 45 in the SFK, and 116 in the UT). Additional sites were identified in the field. Each potential inlet

was visited in the field in 2008 to determine if it was indeed an inlet channel and, if so, to estimate the flow at which the inlet began to transmit flow from the mainstem to the OCH. This mainstem flow level was estimated using inlet connectivity data in conjunction with mainstem transect rating curves. Thirty-five actual inlet channels were identified during the field surveys (11 in the NFK, 11 in the SFK, and 13 in the UT). The remainder of the sites investigated either did not support inflow channels that would be accessed at flow levels below bankfull (75 sites), or represented outflow from beaver ponds (70 sites).

5.7 Fish Sampling

Off-channel sites were sampled between early summer and early fall, with specific sampling months varying between watersheds and years. In the SFK watershed, fish sampling occurred in September 2005, June and August 2006, and July 2007 (Figure 7). The UT sites (Figure 8a and 8b) were sampled in July and October 2007, and the off-channel sites in the NFK (Figure 9) were sampled between late July and mid-August 2008. In general, the off-channel fish survey work was completed after all of the OCH transects had been initially surveyed. The fish field crews were then provided GPS coordinates of the OCH sites, GPS coordinates for specific transects, and OCH types to sample.

The 2005 through 2007 off-channel habitat fish surveys of the SFK and UT watersheds were typically conducted over a length of 60 meters, centered over the intersection point of the OCH transect. Thus, the surveyed segment consisted of 30 meters of habitat upstream from that point and 30 meters downstream of that point. If the OCH was less than 60 meters long, then the entire site was sampled. A variety of sampling techniques (snorkeling, direct observation, and backpack electrofishing) were used to sample the off-channel habitats. The final selection of a specific method depended largely on site conditions, including size, shape, and physical characteristics (water depth, velocity, and habitat complexity). In general, given suitable water clarity, snorkel surveys were the primary method used in conducting the off-channel fish surveys (Photo 10).

In segments where there was noticeable flowing water, snorkel surveys were completed in an upstream direction. In units that were pond-like and circular in shape, snorkelers made several passes in an attempt to cover the entire width of the unit. Bank-side visual observations were made in sections that were too shallow to sample otherwise. In deeper, more complex habitats, two-pass snorkeling was conducted to increase coverage and improve the accuracy of the survey (Slaney and Martin, 1987). All observed fish were identified and enumerated by species and life stage. All captured fish were measured for fork length and released near the point of capture.

During the 2008 NFK off-channel habitat fish surveys, a 40-meter section of each OCH was surveyed. For large and uniform sites (e.g., beaver ponds), the survey team sub-sampled an area representing 15 to 30 percent of the total habitat. Snorkeling was again the primary sampling method used, although multi-pass depletion electrofishing and/or minnow trapping also were utilized when stream conditions (e.g., water depth and visibility) precluded the ability to snorkel. A maximum of three passes was used when sampling with the backpack electrofisher. Any fish visually observed during the survey were identified by species, life stage, and enumerated. As in previous years, all captured fish were measured for fork length and released at the point of capture.

To derive estimates of relative fish abundance by OCH type, fish sampling locations were overlaid upon the OCH map layer and each sampling site was assigned an OCH type (Figures 7, 8a, 8b, and 9). Fish

data were summed by OCH type within each drainage. Relative abundance (number of fish per 100 meters of stream length) was generated from snorkel, electrofishing and minnow trap data. Where sampling length and wetted width data were available, fish densities (i.e., the number of fish/100 m^2) were calculated and compared among OCH types using snorkel and electrofishing catch data.

6. RESULTS

6.1 OCH Topography and Water Surface Elevations

There were 37 valley bottom transects surveyed over the 4-year field study period. An example transect profile and corresponding water surface elevation data for each watershed is presented on Figure 10. Profiles for all transects are provided in Attachment A. In the SFK intensive study area transects were established and were surveyed for physical data in summer 2005. In August 2006, water quality and depth data were collected.

A total of 141 OCHs were surveyed in the three stream basins: 61 in the SFK, 51 in the UT, and 29 in the NFK. Beaver ponds, isolated ponds, and alcoves were most frequently encountered; percolation channels and side channels were the least abundant. The relative number of alcoves and side channels encountered varied considerably by basin. The most side channels were found in the UT (approximately 31) and the fewest in the NFK (4). Alcoves were most abundant in the SFK and least abundant in the NFK.

6.2 OCHs: Intensive Study Area Mapping and Entire Study Area Estimation

6.2.1 INTENSIVE STUDY AREA MAPPING

There were 37.1 hectares of OCH area mapped in all of the intensive study areas; 13.1, 18.6, and 5.3 hectares in the NFK, SFK, and UT basins, respectively. The type and distribution of OCHs in each intensive study area are provided on Figures 7, 8a, 8b, and 9. Beaver ponds were the primary OCH documented in each basin with 85 percent by area in the NFK basin, 91 percent by area in the SFK, and 93 percent by area in the UT basin (Figure 11). Of the secondary OCHs, side channels were generally the next most extensive OCH but covered a substantially reduced area as compared to beaver ponds. The remaining secondary OCHs, percolation channels, pond outlet channels, isolated ponds, and alcoves, were encountered in all of the intensive study areas (Figures 7, 8a, 8b, and 9); however, the area they covered represented a small portion of the total OCH area. Overall, the composition and abundance of OCH types in all three river valleys was similar (Table 2). Although, it is worth noting that in the NFK, percolation channels and pond outlet channels covered similar or more OCH area than any of the secondary OCHs in the SFK or UT.

6.3 Off-channel Habitat Off-channel Habitat Characteristics: Water Depth, Substrates, and Water Quality

Water depth, substrate, and water quality data collected at each OCH unit were used to describe differences in the type of habitat provided by each OCH type identified for this study.

6.3.1 OCH WATER DEPTH

The median average and maximum depth of beaver pond units were lower than that of side channels, alcoves, and isolated ponds (Table 3): however, beaver ponds were the only OCH that exhibited depths greater than 1 meter. Approximately 12 percent of beaver ponds sampled had depth in excess of 1 meter; maximum depth was not recorded in these cases as the ponds were too deep to wade across.….

6.3.2 OCH SUBSTRATES

Substrate composition data indicated that fines were the dominant substrate in all OCHs (Table 3), however in isolated ponds a substantial percentage of the substrate was observed to be cobble. By definition alcoves and isolated ponds are units characterized by zero flow velocity, so the predominance of fine sediment in these units was expected. Most beaver ponds represent former mainstem or side channels and, as such, still contained areas with gravel and cobble substrates. Percolation channels and side channels exhibited active flow during the surveys, and also contained the greatest proportion of gravel to cobble size substrate (Table 3).

6.3.3 OCH WATER QUALITY

Water quality varied widely throughout the study area. Comparison of field water quality measurements across OCHs should be viewed with caution, because the sampling varied over a period of three months in three separate years. However, some generalities were evident (Figure 12). Percolation channels tended to have the coolest water and highest specific conductivity. This is consistent with the input of groundwater into this OCH type. Dissolved oxygen (DO) levels varied widely (2 to 15 milligrams per liter [mg/L]) within and across OCH types, but on average were consistent with levels considered to represent moderate to high quality fish habitat (7 mg/L and greater). Specific conductivity varied widely in beaver ponds, but averages of all OCH types clustered around 40 to 50 microSiemens per centimeter. Not surprisingly, isolated ponds were on average warmer than other waterbodies.

In 2007 and 2008, samples of mainstem water quality were collected from each transect on the same date as water quality sampling was conducted in the OCH. Paired sampling revealed that beaver ponds, beaver pond outlet channels, side channels and isolated ponds were all warmer than the mainstem river during the summer months and had lower levels of DO (Table 4). In contrast, groundwater-fed percolation channels tended to be cooler than the mainstem river. Specific conductivity was similar between mainstem and OCH sites. Alcoves were also cooler than the mainstem. This could be because such sites represent areas where hyporheic flow drains to the river; however, the small sample size limited the ability to confirm such a hypothesis.

6.4 Water Depth Fluctuations

To investigate the hydrologic relationship between the mainstem and OCHs, researchers compared the relative fluctuation in water depth within the mainstem to the water depth fluctuation of representative examples of five of the six OCH types. This comparison was not made with pond outlets, because a direct relationship between pond outlets and mainstem elevation is evident. Pressure transducers recorded water depth at hourly intervals. These data were reduced to average daily water column depths and plotted together to compare fluctuations in water levels (Figure 13).

A couple of logistic issues arose with instrumentation over the sample season. First, Site OCH 3D, one of the few active side channels that had not been influenced by beaver activity at the start of the field season, was dammed by beavers. A subsequent drop in water levels downstream of the dam left the pressure transducer out of the water on exposed substrates. The instrument was retrieved and reinstalled lower in the channel in late July. In addition, a pressure transducer in the mainstem was dislodged by bear activity in late July, and re-installed in August.

Despite the limited data set, several noteworthy trends were observed over the 2008 field season (Figure 13). The side channel and alcove sites, both of which are directly connected to the mainstem, tracked closely with the mainstem water surface fluctuations. All three sites exhibited a general decline in water depth from June through late August, and rapidly responded to late season rain events. In contrast, the water column depth at the beaver pond and percolation channel sites remained generally stable or increased through the late summer. Water depths in the isolated pond site, which was located approximately 35 meters from the mainstem channel, also tracked the mainstem depth fluctuation, although the changes were not as hydrologically flashy."

6.5 Surface Connectivity

The mainstem flow level required to initiate inflow to OCHs that were connected to the main channel, and the total area of these connected OCHs, are presented in Table 5. The cumulative amount of OCH habitat connected by surface inflows increased with mainstem flow up to the point of maximum inundation for all intensive study areas (Figure 14). The majority of OCHs connected to the mainstem via surface inflows were Beaver ponds or Side Channels. Notable exceptions were two Percolation Channels in the NFK that exhibited connectivity to the mainstem river (Table 5).

When mainstem flows become high enough to spill overbank and inundate the entire valley floor, all OCHs receive surface inflows. Overbank flow levels were estimated for each intensive study area based on stage:discharge relationships developed for instream flow incremental methodology transects located within each study site. Overbank flow levels were estimated for intensive study sites in each watershed at approximately 550 cubic feet per second (cfs), 580 cfs, and 620 cfs in the UT, NFK, and SFK, respectively (Appendix 15.1C, Attachment 5) .

6.6 Fish Sampling

At least 11 fish species were observed or captured within the OCH survey areas. In order of dominance, these included four species of anadromous salmonids (coho salmon, sockeye salmon, Chinook salmon, and chum salmon) and three resident salmonids (arctic grayling, Dolly Varden, and rainbow trout), as well as four other fish species groups. Since patterns in abundance and density were similar (Tables 6 and 7), only density values are presented. Fish density patterns were consistent across drainages for anadromous salmonids (Figures 15a, 16a, and 17a), with juvenile coho salmon the predominant species/life stage observed (Photo 11). Overall, densities of coho salmon were more than an order of magnitude greater than other species. Juvenile coho densities by OCH type were as high as 234.04 fish/m^2 as observed in one alcove area in the NFK. Sockeye salmon fry were the second-most commonly found anadromous species throughout the study area, with densities as high as 4.34 fish/100 m^2 calculated for alcove in the NFK. Comparatively few Chinook (0.01 to 7.74 fish/100 m^2) and chum salmon (0.05 fish/100 m^2) were found throughout the study area.

Some general patterns were evident for resident fish abundance in OCH across basins. All OCHs supported resident fish species although the extent and densities varied among OCH type and across basins. Overall, sticklebacks were the most commonly observed species and were present in the greatest densities of all resident fishes. It was interesting to note that where Dolly Varden density was high the density of sticklebacks was low compared to habitat where Dolly Varden were not present or where their densities were low.

Drainage specific variations in fish density were also noted. (Figures 15b, 16b, and 17b). Overall, the NFK OCHs exhibited the highest densities of resident fishes with most densities greater than 1 fish/ $100m^2$ and up to approximately 25 fish/ $100m^2$. The NFK OCHs also had the lowest species richness with only three species present versus five in the UT and six in the SFK.

When considering fish presence among habitat types, the greatest combined anadromous and resident fish densities (over 100 fish/100 m^2) were observed in side channels and in one alcove area within the NFK (Figure 15a). Although there were a few exceptions fish densities of approximately 15to 70 fish/100 m^2 were found in percolation channels and side channels indicating relatively moderate to high fish use in these habitats. One alcove in the UT also had a density of approximately 50 fish/ $100m^2$. Isolated pools had the lowest densities of fish for all sampled habitats ranging from no fish in the NFK to a high of 13 fish/100 m^2 in the UT (Figures 15a and 17b). Certain OCH types were represented by a single sample; therefore, extrapolation beyond specific sites should be done with caution (Tables 6 and 7).

7. DISCUSSION

All three of the primary watersheds within the study area contain substantial off-channel habitats consisting primarily of features created by beaver activity, followed by side channels and isolated ponds. Quantitatively, the area of off-channel habitat contained within beaver ponds represented more than 85 percent of the total amount of OCHs combined, demonstrating the importance and effect that beavers have in generating and maintaining channel and floodplain structure and aquatic habitat within the active river valleys of the NFK, SFK and UT. Beaver ponds were found to be created by the damming of main channels, side channels, and percolation channels. This resulted in an abundance of complex OCH habitat in all three drainages (Figure 11). These results are similar to other studies of off-channel aquatic habitat in river active valleys in glaciated landscapes in North America (Pollock et al., 2003; Pollock et al., 2004; Rosell et al., 2005).

Within all three intensive study areas, researchers mapped a total of 37.1 hectares of beaver ponds, compared to a total of 36.8 hectares of wetted mainstem habitat. The most striking trend in these data is that the total area of off-channel habitat compared to wetted mainstem habitat is consistent in all three drainages with NFK, SFK, and UT off-channel area to mainstem area being 13.1/14.1, 18.6/16.8, 5.3/5.9 hectares respectively. This is most likely the result of similar channel- and floodplain-forming processes occurring in all three drainages. Channel and floodplain forming processes in unconstrained active valleys with relatively unimpacted native beaver populations occurring during the entire holocene have likely resulted in such a stable landscape form and function. Furthermore, these results are consistent with other studies of beaver-generated floodplain waterbodies in glaciated terrain in North America (Muller-Schwarze and Sun, 2003; Pollock et al., 2003; Pollock et al., 2004).

Measurement of water depth, substrate type, and water quality parameters provide a general site description and information about the suitability of OCH for fish and other aquatic organisms. Although there were a few outliers for DO and specific conductivity, the majority of the water quality values fell within the ranges suitable for fish rearing. Thus, these results suggest that the general quality of the habitat provided by the OCHs would support anadromous salmonid production.

The results of the water level transducer study show that waterbodies with a direct hydrologic connection to the mainstem channel (side channel and alcove sites), as expected, closely track mainstem water surface level fluctuations, while other OCHs (beaver ponds and percolation channels) do not. Instead, the water surface levels of beaver ponds and percolation channels were generally more stable than the mainstem during summer and early fall and do not follow mainstem peak water surface level fluctuations. The beaver ponds and percolation channels are probably influenced by groundwater, seeps, and/or springs and, therefore, have a diminished reduction in water during low precipitation periods compared to the mainstem. These contrasting hydrologic conditions provide additional evidence that the OCHs likely serve as fish habitat during low mainstem river flow periods.

Water level fluctuations were not measured for late fall, winter and early spring months when freezing becomes a prominent element potentially restricting the area of available fish habitat. The total OCH area of juvenile salmonid habitat throughout the active valley obviously varies with hydroregime and seasonal climatic conditions. A full measure of critical salmonid habitat would need to take into account overwinter habitat conditions within OCHs and mainstem.

The findings related to surface connectivity illustrate that the area of OCH habitat influenced by surface water flows increases with mainstem flow in all three rivers and reaches an active valley flooding threshold at bank full discharge. This simple relationship indicates the OCHs are strongly influenced by seasonal variability of surface water sources. Furthermore, alterations of the natural flow regime would likely have a range of direct effects on both OCH quantity and quality.

Results of the fish surveys indicate that off-channel habitats provide rearing habitat for several stream resident and freshwater life stages of anadromous fishes. Beaver ponds and beaver pond outlet channels, when combined, were the only OCH type that supported all fish species observed in off-channel habitat. Fish appeared to be present in moderate densities within beaver-influenced off-channel habitat. However, the extensive areas covered by beaver ponds combined with low visibility due to turbid conditions when sampling, and variable water depths, made extensive sampling of these ponds challenging and we were largely limited to subsampling near edge habitat in beaver ponds.

Beaver ponds are the OCH type that was sub-sampled most frequently, with the survey area generally limited to sampling at one end or along the edge of the larger complexes. Additional information of the value of beaver ponds comes from aerial spawning surveys. Adults of both coho salmon and sockeye salmon have been observed spawning in active beaver ponds and milling in sloughs created by abandoned beaver dams. Although the number of spawners observed at any one time was less than 20, approximately 372 and 66, respectfully, sockeye were observed milling in UT and SFK relic beaver sloughs.

8. SUMMARY

The data from this study indicate that off-channel habitat within the study area is clearly important for rearing of juvenile coho salmon. Habitat mapping of the mainstem rivers within the study area show that these channels are fairly uniform and are composed primarily of alternating glide and riffle habitat types (Appendix 15.1B), with generally few pools. Such areas, while providing excellent adult holding and spawning habitats, do not contain the types of habitat features conducive to juvenile anadromous salmonid rearing, especially coho salmon. In contrast, the habitat mapping from this off-channel study shows that the beaver ponds contain extensive and diverse pool habitats that dominate the active valley floor. The existing literature on habitat use for coho salmon recognizes the importance of pool habitat for rearing of juvenile coho salmon (Cunjack, 1996; Nickelson et al., 1992, Pollock et al., 2003; Pollock et al. 2004). Working in Southeast Alaska streams, Bryant (1983) found that beaver-created impoundments support larger juvenile coho salmon populations than adjacent areas lacking impoundments. Given the lack of pool habitat in the mainstem channels, these off-channel habitats provide a critical habitat component for freshwater rearing of coho salmon and, to a lesser extent, other anadromous and resident species.

Pool habitat is also important for overwinter survival of stream fishes. Increased overwinter survival for coho salmon populations was found in streams with high pool: riffle ratios (Nickelson et al., 1992). Beaver ponds also have been found to provide critical overwintering habitat for juvenile coho salmon (Nickelson et al., 1992; Pollock et al., 2003; Sanner, 1987). Within the intensive study areas, coho salmon were present in greatest numbers in percolation channels, side channels, beaver ponds and alcoves. In the study area, these OCH types are often associated with groundwater inflow and, as such, would represent potential overwintering habitat for juvenile coho salmon and other species. Recent studies have also shown that coho salmon can and will utilize freshwater emergent wetlands within floodplain habitats, provided ingress and egress areas can be found (Henning et al., 2006).

This study demonstrates that there is substantial off-channel habitat area within the three watersheds that temporally and spatially provide rearing habitats for juvenile salmonids and resident fishes. The results also indicate that some of the OCHs, including those with moderate and high densities of fishes, have a hydrologic connection to the mainstem and, thus, the area of wetted habitat available will expand or contract along with changes in mainstem flows. Further conclusions about the relative value of this off-channel habitat are not recommended. This study was subject to logistical limitation both spatially due to an initial focus on selecting river reaches with high concentrations of off-channel habitat, and temporally by surveying and sampling only during summer(winter sampling in the project area has been proven to be challenging and poses high safety risks). These study-design limitations restrict the ability to infer the relative value of these off-channel habitats as compared to main channel habitats, as well as for their overall contribution to fish production in the three river basins.

10. GLOSSARY

avulsion—The rapid abandonment of a river channel and the formation of a new river channel as a result of channel slopes that are much lower than the slope that the river could travel if it took a new course.

flashy - A flashy stream is one that exhibits significantly increased flows immediately following the onset of a precipitation event and a rapid return to pre-rain conditions shortly after the end of the precipitation. That is to say, water that precipitates within a flashy stream's watershed will make its way quickly from the land into the stream and be flushed through the system rapidly.

hyporheic flow—The subsurface flow between the water table and surface water flow.

kinematic satellite navigation—A survey technique based on the use of carrier phase measurements of the GPS where a single reference station provides real-time corrections, providing up to centimeter-level accuracy.

plane bed—Description of a stream that has a featureless bed that lacks a distinct sequence of bed features such as riffles and pools.

Off-channel Habitat Topography and Water Surface Elevations

Off-channel Habitat Topography and Water Surface Elevations

The following figures represent the topography at selected transects through off-channel habitat (OCH) areas in the North Fork Koktuli Rivers (NFK), South Fork Koktuli River (SFK), and Upper Talarik Creek (UT). These plots are based on global positioning system (GPS) points collected by HDR Inc. (HDR) and R2 Resource Consultants (R2) during the initial survey of each transect. The water surface elevations (WSEs) depicted on the graph for each OCH unit encountered and for the main stem of the river channel correspond to a single site visit. Other WSE data from other site visits are available in the complete dataset. For representational clarity, only one WSE is shown on the plot of each transect. The transect profiles are plotted such that the graphs represent a view looking downstream.

R2 surveyed the off-channel habitats in the NFK. Distinct aquatic habitat units that were located within the off-channel area and were crossed by the transect were identified with a unique code that indentified the location of the unit along the transect. The code begins with OCH to indicate that this is an off-channel habitat transect. OCH is followed by a transect number (1, 2, 3, etc.) and then a letter (A, B, C, etc.) indicating the sequential location of the unit from the start of the transect. OCH units on the opposite side of the main channel from previously identified units were given a double letter (e.g., AA). R2 did not survey in the main channel of the river; therefore, the plotted transect profiles show a gap at the main channel. The WSE for the main channel (MC WSE), as with all OCH units, is represented by a blue horizontal line, and this line does not denote the topography of the main channel.

HDR surveyed OCHs in the SFK and UT. Each survey started at the left bank of the main channel, and the OCH units were numbered as moving away from the channel. Thus, OCH Unit #1 is closer to the main channel than OCH Unit #2, and so on. Also, HDR used the letter “H” to identify those OCH units to the left of the main channel (looking downstream), and the letter “T” for those OCH units to the right of the main channel. In the SFK basin, HDR did not survey in the main channel of the river; therefore, the transect profiles show a gap at the main channel. The MC WSE, as with all OCH units, is represented by a blue horizontal line, and this line does not denote the topography of the main channel. In the UT basin, HDR did survey across the main channel, and these transect profiles show a continuous line. This line, however, should not be considered a full representational survey of the main channel.

These transect plots are presented only as a graphic representation of the topography of the valley through which the transect lies. Slight modifications in WSE and ground elevations may have been necessary for the transect profile to be graphed properly.

OPEN WATER RIVER TEMPERATURE MODEL

1. INTRODUCTION

An instream flow habitat study (instream flow study) was initiated in 2004 as part of the environmental baseline studies associated with the Pebble Project. The study area specific to the instream flow study includes the upper portion of the mainstem Koktuli River (KR) and the full lengths of the South Fork Koktuli River (SFK), North Fork Koktuli River (NFK), and Upper Talarik Creek (UT; Figure 1). Primary components of the instream flow study involve: the relationship of flow to both main-channel and off-channel habitats, surface water temperature, geomorphology, availability of suitable spawning habitat, and fish use. This appendix is specific to the surface water temperature aspects of the instream flow study and includes a review of water temperature measurements, and development of surface water temperature models of the SFK, NFK, and UT.

Water temperature can affect a variety of salmonid species and their life history functions, including: the timing of adult upstream migrations, juvenile/smolt downstream migrations, and spawning and duration of egg incubation; growth rates; and overall rates of survival (Bjornn and Reiser, 1991; McCullough et al., 2001; Quinn, 2005; Sauter et al., 2001). Temperatures in streams can vary hourly, daily, seasonally, annually, and spatially. The degree of variation depends on meteorological, topographical, and hydrological characteristics including patterns of runoff and groundwater exchange. Because stream temperature can be directly influenced by flow (both surface and groundwater), it is important to understand how changes in streamflow may also affect water temperatures within the study area streams.

To facilitate this understanding, stream temperature models were developed and calibrated for each of the three major streams in the study area: the SFK, NFK, and UT. These models were used to define the baseline thermal regimes of the respective systems from which to evaluate potential thermal changes that could occur as a result of any alterations in flow regimes.

A stream temperature model was not developed for the KR because water temperatures were not monitored in the KR; therefore, there were no data available for calibrating a model of the KR. Stream temperatures at the upstream end of the KR were estimated by combining the flows and water temperatures from the downstream ends of the SFK and NFK, and performing a mixing calculation.

1.1 GOALS AND OBJECTIVE(S)

The overall goal of the stream temperature modeling study was to define temperature: flow relationships for each of the channel reaches measured and modeled, that can be used to:

- Characterize the baseline thermal conditions in the SFK, NFK, and UT.
- Predict potential temporal and spatial changes in temperatures that could occur as a result of any changes in flow regimes.
- Assess flow and temperature change effects on important fish species within these systems.

The assessment was completed via application of the latest version (Version 3, revised in May 2005) of the U.S. Fish and Wildlife Service's (USFWS's) Stream Network Temperature (SNTEMP) Model (Theurer et al., 1984), which is one component of the Instream Flow Incremental Methodology (IFIM) (Stalnaker et al., 1995).

Specific objectives of the stream temperature modeling study were as follows:

- Compile and review existing water temperature data that have been collected within project area streams.
- Maintain and download data from the existing network of temperature monitors within the SFK, NFK, and UT watersheds.
- Collect, compile, and review other meteorological, hydrological, and channel morphological data, including riparian shade information, that are necessary for developing the stream temperature models.
- Develop and calibrate individual stream temperature models for the SFK, NFK, and UT that would be useful for evaluation of potential impacts of flow changes on the thermal regimes of these three systems, and also on the upstream end of the KR.

1.2 MODEL SELECTION

From a thermal modeling perspective, two different seasons can be defined for the three study streams: a season with no ice cover and a season with ice cover. The models developed for this study were based on SNTEMP, a one-dimensional hydrothermal model developed by the USFWS (Theurer et al., 1984). This model is most accurate under conditions with no ice cover and, therefore, SNTEMP models were developed to cover the period of mid-May through mid-October for each of the three systems.

The SNTEMP model was developed to predict instream water temperatures based on either historical or synthetic hydrological, meteorological, and stream geometry conditions. The model can be applied to any size watershed or river basin with a stream network of any stream order and complexity. The model accounts for the physical processes of heat transfer with the following components:

- A heat transport model that predicts the average mean daily water temperature and diurnal fluctuations in water temperature as functions of stream distance.
- A heat flux model that predicts the energy balance between the water and its surrounding environment.
- A solar model that predicts the solar radiation that penetrates the water as a function of latitude, time of year, and meteorological conditions.
- A shade model that predicts the solar radiation-weighted shading resulting from both topography and riparian vegetation.
- Meteorological corrections that predict changes in air temperature, relative humidity, and atmospheric pressure as functions of a change in elevation.

The SNTEMP model requires meteorological and hydrologic data, as well as stream morphological characteristics. Instream water temperature data are used to calibrate the model.

Meteorological data required by the SNTEMP model consist of air temperature, relative humidity, sunshine ratio (the ratio of the actual solar radiation that reaches the ground surface to the solar radiation that would have reached the ground surface if there were no clouds), and wind speed. These data were obtained from meteorological stations established for the Pebble Project. Solar radiation is entirely modeled as a function of the latitude of the stream basin, time of the year, and prevailing meteorological conditions. Shading, resulting from both topographic features and riparian vegetation, is modeled as a function of latitude, time, basin topographic characteristics, and riparian vegetation parameters.

Hydrological data required by the model consist of discharge or flow data throughout the stream system and initial water temperatures at the beginning points. The hydrological data were developed from synthetic hydrological procedures, or empirical data collected at various stream gaging stations within the study area. Calibration of the stream temperature models developed for the Pebble Project was based on flows measured by the United States Geological Survey (USGS) and the Pebble Project.

Instream water temperature is needed for all input locations of the stream network. Calibration of the stream temperature models developed for the Pebble Project were based on water temperature data collected in the SFK, NFK, UT, and major tributaries of those streams.

Stream morphology information needed consists of the stream system network (mainstem and tributaries), stream widths, stream gradients, and hydraulic roughness. The stream temperature models developed for the Pebble Project were based on surveyed instream flow measurements.

Instream temperature models differ from lake models because the downstream water movement tends to mix the water. This turbulent mixing is assumed to evenly distribute the temperature both vertically and transversely and, therefore, is the basis for using a constant water temperature throughout a given cross section at any given instant. The purpose of the heat transport model (a component of SNTEMP) is to predict the longitudinal temperature variation. While the temperature at a specific cross section may be constant at any given time, a downstream differential is expected and predicted by the heat transport model.

The turbulent mixing, leading to a homogeneous distribution of temperature throughout a given cross section, simplifies the application of the heat flux relationships part of the SNTEMP model. All heat entering the water is assumed to be immediately distributed both vertically and transversely. All heat leaving the water is a function of the homogeneous water temperature. Flowing water generally mixes at a far faster rate due to turbulence rather than either conduction or convection within the water.

1.3 GEOGRAPHIC AREA

The geographic area of the SNTEMP model included the following three river segments:

- The SFK from the outlet of Frying Pan Lake to the confluence with the NFK. This includes reaches SFK-A through SFK-D (Figure 2).
- The NFK from the headwaters to the confluence with the SFK. This includes reaches NFK-A through NFK-F (Figure 3).
- The UT from the headwaters to the confluence with Iliamna Lake. This includes reaches UT-A through UT-G (Figure 4).

1.4 REVIEW OF AVAILABLE STREAM TEMPERATURE DATA

As an initial step in the SNTEMP model development, available stream water temperature records from various sites in the SFK, NFK, and UT were obtained and reviewed. These records were obtained from the following sources:

- Pebble Project hydrology gaging stations – These continuous stations monitor both water stage (water surface elevation referenced to a local site vertical datum) and temperature. The names of these stations start with the prefixes "SK," "NK," or "UT" for the SFK Basin, NFK Basin, or UT Basin, respectively.
- Pebble Project water temperature monitoring stations – These continuous stations monitor water temperature. The names of these stations start with the prefixes "SFK," "NFK," or "UT" for the SFK Basin, NFK Basin, or UT Basin, respectively.
- USGS hydrology gaging stations – These continuous stations monitor both water stage and temperature. The USGS gaging stations on the SFK, NFK, and UT are named SK100B (USGS Gage No. 15302200), NK100A (USGS Gage No. 15302250), and UT100B (USGS Gage No. 15300250), respectively.

Water temperature was monitored in each of the three basins from 2004 through 2007. Water temperature records from this time period for all three of the above sources were compiled for use in the SNTEMP model. Additional water temperature monitoring was carried out in 2008 and 2009; these water temperature records were not incorporated in the model but are presented in general temperature trend analyses.

1.4.1 SOUTH FORK KOKTULI RIVER

The locations of stations where water temperatures have been and/or continue to be monitored in the SFK Basin are shown on Figure 2. A spatial and temporal inventory of water temperature records for the SFK Basin is illustrated on Figure 5. These water temperatures were measured continuously at intervals ranging from 1 minute to 2 hours.

A detailed summary of water temperatures measured in the SFK Basin is presented in Attachment 1. This attachment includes water temperature data measured at the following nine temperature monitors in the SFK Basin (Figure 2):

- SK100G – Pebble hydrology gage, River Kilometer (RK) 58.01 in SFK-E.
- SK100F – Pebble hydrology gage, RK 54.67 in SFK-D.
- SK100C – Pebble hydrology gage, RK 35.81 in SFK-C.
- SK119A – Pebble hydrology gage, Tributary SFK 1.190, confluence with the SFK at RK 34.28 in SFK-B.
- SK100B1 – Pebble hydrology gage, RK 29.26 in SFK-B.
- SFK4WT – Pebble water temperature monitoring site, RK 29.23 in SFK-B.
- SK100B – USGS hydrology gage (USGS Gage No. 15302200), RK 24.90 in SFK-B.

- SFK2WT – Pebble water temperature monitoring site, RK 13.93 in SFK-A.
- SK100A – Pebble hydrology gage, RK 0.11 in SFK-A.

The data presented in Attachment 1 for these nine sites consist of thermographs of daily maximum, average, and minimum water temperatures for 2004 through 2007. In addition, tables are presented of monthly minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures for 2004 through 2007.

Most of the water temperature measurements were obtained during the summer ice-free period, as shown Figure 5. The best spatial coverage of water temperature data was obtained in 2007. Consequently, the summer ice-free period of 2007 was selected for development of a water temperature model (SNTEMP) of the SFK. Details of the development and calibration of this model for the SFK are provided in Section 3of this appendix.

Additional water temperature records were collected and compiled after the water temperature model was developed (Attachment 2). This attachment includes water temperature data measured in 2008 and 2009 at the following nine temperature monitors in the South Fork Koktuli River Basin (Figure 2):

- SFK7WT – Pebble water temperature monitoring site, RK 54.67 in SFK-D.
- SFK6WT – Pebble water temperature monitoring site, RK 40.94 in SFK-C.
- SFK5WT – Pebble water temperature monitoring site, RK 35.81 in SFK-C.
- SFK119WT – Pebble water temperature monitoring site, SFK 1.190, confluence with the SFK at RK 34.28 in SFK-B.
- SFK4WT – Pebble water temperature monitoring site, RK 29.23 in SFK-B.
- SK100B – USGS hydrology gage (USGS Gage No. 15302200), RK 24.90 in SFK-B.
- SFK3WT – Pebble water temperature monitoring site, RK 24.90 in SFK-B.
- SFK2WT – Pebble water temperature monitoring site, RK 13.93 in SFK-A.
- SFK1WT – Pebble water temperature monitoring site, RK 0.10 in SFK-A.

The data presented in Attachment 2 for these nine sites consist of thermographs of daily maximum, average, and minimum water temperatures for 2008 and 2009. In addition, tables are presented of monthly minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures for 2008 and 2009. The additional water temperatures reported for 2008 and 2009 do not include water temperatures measured at the Pebble hydrology gages, or water temperatures measured by the USGS after September 2008 at SK100B (USGS Gage No. 15302200).

The water temperature model developed for the SFK is specific to the summer ice-free period in 2007. It was based on flow and water temperature data from 2007 that were available at the time model was developed. Water temperature models have not been developed for the SFK for 2008 or 2009, but are presented in general temperature trend analyses.

Water temperature data reported by the USGS have been rounded off to the nearest 0.5 degrees Celsius (ºC). This suggests that water temperatures measured at a single point in a cross-section may be

representative of the cross-sectional average temperature to within plus or minus 0.25ºC. This would apply to most locations along a stream where the flow is well-mixed and the water temperatures are evenly distributed over the cross-section. However, there may be situations where the flow may not be well-mixed across the entire width and depth of the cross-section. Examples of these situations would include reaches just downstream from tributary confluences, and just downstream from upwelling areas. These localized reaches would be relatively short and would represent a small portion of the overall stream length.

An overall summary of monthly average water temperatures from all of the temperature monitors is presented in Table 1 for the years 2004 through 2009. Water temperatures in the SFK Basin generally peak in July and August, then cool down during September and October, stay near freezing from November through April, and then warm up during May and June.

Since water temperatures remain near freezing during the winter season, there is obviously greater variability in water temperatures during the summer. For July and August:

- Average monthly temperatures ranged from 7.2ºC at Hydrology Gage SK100B1 in SFK-B in July 2007 to 16.0ºC at Hydrology Gage SK100F in SFK-D in August 2004 (Table 1).
- Average daily temperatures ranged from 5.7ºC at Hydrology Gage SK100B1 in SFK-B in July 2007 to 20.3ºC at Hydrology Gage SK100F in SFK-D in August 2004 (Attachments 1 and 2).
- Instantaneous temperatures ranged from 3.8ºC at monitoring site SFK4WT in SFK-B in August 2008 to 24.4ºC at Hydrology Gage SK100F in SFK-D in August 2004 (Attachments 1 and 2).

Generally speaking, water temperatures would be expected to increase in the downstream direction in a stream because air temperatures generally increase in the downstream direction (with decreasing elevations). However, exceptions to these expected trends may occur when the stream receives input from a source of relatively cold water (surface water and/or groundwater).

Longitudinal trends of maximum instantaneous, daily average, and minimum instantaneous water temperatures in the SFK are illustrated on Figure 6 for late summer (August 24, 2007) and late fall (October 21, 2007) conditions. On August 24, 2007, water temperatures in upstream reaches SFK-C and SFK-D were warmer than the water temperatures in the downstream reaches SFK-A and SFK-B. This suggests that there is an input of relatively cool water near the upstream end of SFK-B.

On August 24, 2007, the average flow and water temperature at hydrology gage SK100C (near the downstream end of SFK-C at RK 35.81) were 0.10 cubic meters per second (cms) and 12.8ºC, respectively (Chapter 7 and Attachment 1, respectively). On the same day, the average flow and water temperature at hydrology gage SK100B1 (in SFK-B at RK 29.26) were 1.46 cms and 7.4ºC. In between these two locations, the SFK gained 1.36 cms and cooled down a total of 5.4ºC.

Part of the cooling can be accounted for by examining conditions in Tributary SFK 1.190 on August 24, 2007. This tributary enters the SFK at RK 34.28 (between hydrology gages SK100C and SK100B1). The average flow and water temperature at hydrology gage SK119A were 0.56 cms and 8.8ºC, respectively (Chapter 7 and Attachment 1, respectively).

In addition to the input from Tributary 1.190, the SFK gained an additional 0.80 cms in between hydrology gages SK100C and SK100B1. If this was examined purely from a mixing point of view, and all other sources of heating and cooling were ignored, then the average temperature of the additional inflow would be 5.7ºC. The actual temperature would likely be less than 5.7ºC to compensate for the expected warming effect from downstream increases in air temperature. This low temperature suggests that the additional inflow comes largely from groundwater.

A reverse trend can be seen on October 21, 2007. The water temperatures warm up from 1.5ºC to 2.1ºC as flow travels from SK100C to SK100B1. The combined input from Tributary SFK 1.190 and other sources (surface water and groundwater) helped to warm the water as it traveled through this reach.

During the winter period, intermittent contributions of relatively warm groundwater help to keep some portions of the SFK relatively ice-free.

1.4.2 NORTH FORK KOKTULI RIVER

The locations of stations where water temperatures have been and/or continue to be monitored in the NFK Basin are shown on Figure 3. A spatial and temporal inventory of water temperatures records in the NFK Basin is illustrated on Figure 7. These water temperatures were measured continuously at intervals ranging from 1 minute to 2 hours.

A detailed summary of water temperatures measured in the NFK Basin is presented in Attachment 3. This attachment includes water temperature data measured at the following nine temperature monitors in the NFK Basin (Figure 3):

- NFK9WT – Pebble water temperature monitoring site, RK 51.39 in NFK-E.
- NFK8WT – Pebble water temperature monitoring site, RK 44.54 in NFK-D.
- NFK7WT – Pebble water temperature monitoring site, RK 36.87 in NFK-D.
- NK100C – Pebble hydrology gage, RK 36.76 in NFK-D.
- NK119A – Pebble hydrology gage, Tributary NFK 1.190, confluence with the NFK at RK 36.52 in NFK-C.
- NK100B – Pebble hydrology gage, RK 35.76 in NFK-C.
- NFK5WT – Pebble water temperature monitoring site, RK 33.44 in NFK-C.
- NK100A1 – Pebble hydrology gage, RK 13.70 in NFK-B.
- NK100A – USGS hydrology gage (USGS Gage No. 15302250), RK 5.27 in NFK-A.

The data presented in Attachment 3 for these nine NFK sites consist of thermographs of daily maximum, average, and minimum water temperatures for 2004 through 2007. In addition, tables are presented of monthly minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures for 2004 through 2007.

Most of the water temperature measurements were obtained during the summer ice-free period, as shown Figure 7. The best spatial coverage of water temperature data was obtained in 2007. Consequently, the

summer ice-free period of 2007 was selected for development of a water temperature model (SNTEMP) of the NFK. Details of the development and calibration of this model are provided in Section 4of this appendix.

Additional water temperature records were collected and compiled after the water temperature model was developed. A detailed summary of these additional water temperatures measured in the NFK Basin is presented in Attachment 4. This attachment includes water temperature data measured in 2008 and 2009 at the following 10 temperature monitors in the NFK Basin (Figure 3):

- NFK9WT – Pebble water temperature monitoring site, RK 51.39 in NFK-E.
- NFK8WT – Pebble water temperature monitoring site, RK 44.54 in NFK-D.
- NFK7WT – Pebble water temperature monitoring site, RK 36.87 in NFK-D.
- NFK119WT – Pebble water temperature monitoring site, Tributary NFK 1.190, confluence with the NFK at RK 36.52 in NFK-C.
- NFK5WT – Pebble water temperature monitoring site, RK 33.44 in NFK-C.
- NFK4WT – Pebble water temperature monitoring site, RK 19.94 in NFK-B.
- NFK3WT – Pebble water temperature monitoring site, RK 15.41 in NFK-B.
- NK100A – USGS hydrology gage (USGS Gage No. 15302250), RK 5.27 in NFK-A.
- NFK2WT – Pebble water temperature monitoring site, RK 5.27 in NFK-A.
- NFK1WT – Pebble water temperature monitoring site, RK 0.29 in NFK-A.

The data presented in Attachment 4 for these 10 sites consist of thermographs of daily maximum, average, and minimum water temperatures for 2008 and 2009. In addition, tables are presented of monthly minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures for2008 and 2009. The additional water temperatures reported for 2008 and 2009 do not include water temperatures measured at the Pebble hydrology gages, or water temperatures measured by the USGS after September 2008 at NK100A (USGS Gage No. 15302250).

The water temperature model developed for the NFK is specific to the summer ice-free period in 2007. It was based on flow and water temperature data from 2007 that were available at the time model was developed. Water temperature models have not been developed for the NFK for 2008 or 2009 but are presented in general temperature trend analyses.

As for the SFK, water temperature data reported by the USGS for the NFK have been rounded off to the nearest 0.5ºC. This suggests that water temperatures measured at a single point in a cross-section may be representative of the cross-sectional average temperature to within plus or minus 0.25ºC. This would apply to most locations along a stream where the flow is well-mixed and the water temperatures are evenly distributed over the cross-section. However, there may be situations where the flow may not be well-mixed across the entire width and depth of the cross-section. Examples of these situations would include reaches just downstream from tributary confluences, and just downstream from upwelling areas. These localized reaches would be relatively short and would represent a small portion of the overall stream length.

An overall summary of monthly average water temperatures from all of the temperature monitors is presented in Table 2 for the years 2004 through 2009. Water temperatures in the NFK Basin generally peak in July and August, cool down during September and October, stay near freezing from November through April, and then warm up during May and June.

Since water temperatures remain near freezing during the winter season, there is obviously greater variability in water temperatures during the summer. For July and August:

- Average monthly temperatures ranged from 7.5ºC at monitoring site NFK9WT in NFK-E in August 2008 to 14.9ºC at monitoring site NFK8WT in NFK-D in July 2009 (Table 2).
- Average daily temperatures ranged from 6.6ºC at monitoring site NFK9WT in NFK-E in August 2008 to 20.1ºC at monitoring site NFK8WT in NFK-D in July 2009 (Attachments 3 and 4).
- Instantaneous temperatures ranged from 4.7ºC at monitoring site NFK9WT in NFK-E in August 2008 to 22.3ºC at monitoring site NFK8WT in NFK-D in July 2009 (Attachments 3 and 4).

Generally speaking, water temperatures would be expected to increase in the downstream direction in a stream because air temperatures generally increase in the downstream direction (with decreasing elevations). However, exceptions to these expected trends may occur when the stream receives input from a source of relatively cold water (surface water and/or groundwater).

Longitudinal trends of maximum instantaneous, daily average, and minimum instantaneous water temperatures in the NFK are illustrated on Figure 8 for late summer (August 29, 2007) and late fall (October 20, 2007) conditions. On August 29, 2007, water temperatures in the upstream reaches (NFK-D and NFK-E) were warmer than the water temperatures in the downstream reaches (NFK-A, NFK-B, and NFK-C). This suggests that there is an input of relatively cool water in NFK-C. On October 20, 2007, there was a slight warming trend in NFK-E and NFK-D, a drop in water temperature at the confluence with Tributary NFK 1.190, and a slight warming trend in NFK-C, NFK-B, and NFK-A.

On August 29, 2007, the average flow and water temperature at hydrology gage NK100C (just upstream from the confluence with Tributary NFK 1.190 at RK 36.76) were 0.70 cms and 13.4ºC, respectively (Chapter 7 and Attachment 3, respectively). On the same day, the average flow and water temperature at hydrology gage NK100B (just downstream from the confluence with Tributary NFK 1.190 at RK 35.76) were 1.03 cms and 11.9ºC. In between these two locations, the NFK gained 0.33 cms and cooled down a total of 1.5ºC.

The primary source of cool water between hydrology gages NK100C and NK100B would have been Tributary NFK 1.190. If a simple mixing calculation were performed and other sources of heating and cooling were ignored, then the estimated water temperature in Tributary NFK 1.190 would have been 8.7ºC on August 29, 2007. The actual measured water temperature at hydrology gage NK119A was 8.7ºC on August 29, 2007 (Attachment 3), which matches the temperature estimated from the mixing calculation.

On August 29, 2007, the average flow and water temperature at hydrology gage NK100A1 were 2.51 cms and 10.3ºC, respectively (Chapter 7 and Attachment 3, respectively). In between hydrology gages NK100B and NK100A1, the river gained 1.48 cms and cooled down a total of 1.6ºC. If this was examined purely from a mixing point of view, and all other sources of heating and cooling were ignored, then the

average temperature of the additional inflow would be 9.3ºC. The actual temperature would likely be less than 9.3ºC to compensate for the expected warming effect from downstream increases in air temperature.

While the results shown on Figure 8 suggest a gradual reduction in water temperature over the 22.06-kilometer long reach between hydrology gages NK100B and NK100A1, the monthly average results shown in Table 2 suggest that there is a large drop in temperature during summer months over the 13.50-kilometer long reach between water temperature monitoring sites NFK5WT and NFK4WT (located between hydrology gages NK100B and NK100A1). In July 2009, the average monthly temperature dropped from 13.4ºC at NFK5WT to 9.8ºC at NFK4WT. This suggests inflow of relatively cool groundwater between water temperature monitoring sites NFK5WT and NFK4WT during the summer months.

The monthly results shown in Table 2 also suggest a drop in water temperature during the summer months between water temperature monitoring sites NFK2WT and NFK1WT. In July 2009, the average monthly temperature dropped from 12.2ºC at NFK2WT to 10.3ºC at NFK1WT. This suggests the inflow of relatively cool groundwater during the summer months in the downstream portion of NFK-A.

During the winter period, intermittent contributions of relatively warm ground water help to keep some portions of the NFK relatively ice-free.

1.4.3 UPPER TALARIK CREEK

The locations of stations where water temperatures have been and/or continue to be monitored in the UT Basin are shown on Figure 4. A spatial and temporal inventory of water temperature records in the UT Basin is illustrated on Figure 9. These water temperatures were measured continuously at intervals ranging from 1 minute to 2 hours.

A detailed summary of water temperatures measured in the UT Basin is presented in Attachment 5. This attachment includes water temperature data measured at the following 11 temperature monitors in the UT Basin (Figure 4):

- UT100E – Pebble hydrology gage, RK 59.97 in UT-G.
- UT100D – Pebble hydrology gage, RK 51.62 in UT-F.
- UT135A – Pebble hydrology gage, Tributary UT 1.350, confluence with the UT at RK 45.05 in UT-E.
- UT100C2 – Pebble hydrology gage, RK 44.63 in UT-E.
- UT100C1 – Pebble hydrology gage, RK 37.64 in UT-E.
- UT5WT – Pebble water temperature monitoring site, RK 29.33 in UT-D.
- UT100C – Pebble hydrology gage, RK 29.31 in UT-D.
- UT119A – Pebble hydrology gage, Tributary UT 1.190, confluence with the UT at RK 24.74 in UT-C.
- UT100B – USGS hydrology gage (USGS Gage No. 15300250), RK 24.50 in UT-C.
- UT3WT – Pebble water temperature monitoring site, RK 17.23 in UT-C.

- UT1WT – Pebble water temperature monitoring site, RK 2.22 in UT-A.

The data presented in Attachment 5 for these 11 sites consist of thermographs of daily maximum, average, and minimum water temperatures for 2004 through 2007. In addition, tables are presented of monthly minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures for 2004 through 2007.

Most of the water temperature measurements were obtained during the summer ice-free period, as shown on Figure 9. The best spatial coverage of water temperature data was obtained in 2007. Consequently, the summer ice-free period of 2007 was selected for development of a water temperature model (SNTEMP) of the UT. Details of the development and calibration of this model are provided in Section 5 of this appendix.

Additional water temperature records were collected and compiled after the water temperature model was developed. A detailed summary of these additional water temperatures measured in the UT Basin is presented in Attachment 6. This attachment includes water temperature data measured in 2008 and 2009 at the following 12 temperature monitors in the NFK Basin (Figure 4):

- UT8WT – Pebble water temperature monitoring site, RK 51.62 in UT-F.
- UT135AWT – Pebble water temperature monitoring site, Tributary UT 1.350, confluence with the UT at RK 45.05 in UT-E.
- UT135BWT – Pebble water temperature monitoring site, Tributary UT 1.350, confluence with the UT at RK 45.05 in UT-E.
- UT7WT – Pebble water temperature monitoring site, RK 43.29 in UT-E.
- UT6WT – Pebble water temperature monitoring site, RK 37.16 in UT-E.
- UT5WT – Pebble water temperature monitoring site, RK 29.33 in UT-D.
- UT119WT – Pebble water temperature monitoring site, Tributary UT 1.190, confluence with the UT at RK 24.74 in UT-C.
- UT100B – USGS hydrology gage (USGS Gage No. 15300250), RK 24.50 in UT-C.
- UT4WT – Pebble water temperature monitoring site, RK 24.38 in UT-C.
- UT3WT – Pebble water temperature monitoring site, RK 17.23 in UT-C.
- UT2WT – Pebble water temperature monitoring site, RK 9.90 in UT-B.
- UT1WT – Pebble water temperature monitoring site, RK 2.22 in UT-A.

The data presented in Attachment 6 for these 12 sites consist of thermographs of daily maximum, average, and minimum water temperatures for 2008 and 2009. In addition, tables are presented of monthly minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures for 2008 and 2009. The additional water temperatures reported for 2008 and 2009 do not include water temperatures measured at the Pebble hydrology gages, or water temperatures measured by the USGS after September 2008 at UT100B (USGS Gage No. 15300250).

The water temperature model developed for UT is specific to the summer ice-free period in 2007. It was based on flow and water temperature data from 2007 that were available at the time model was developed. Water temperature models have not been developed for UT for 2008 or 2009 but are presented in general temperature trend analyses.

Water temperature data reported by the USGS have been rounded off to the nearest 0.5ºC. This suggests that water temperatures measured at a single point in a cross-section may be representative of the cross-sectional average temperature to within plus or minus 0.25ºC. This would apply to most locations along a stream where the flow is well-mixed and the water temperatures are evenly distributed over the cross-section. However, there may be situations where the flow may not be well-mixed across the entire width and depth of the cross-section. Examples of these situations would include reaches just downstream from tributary confluences, and just downstream from upwelling areas. These localized reaches would be relatively short and would represent a small portion of the overall stream length.

An overall summary of monthly average water temperatures from all of the temperature monitors is presented in Table 3 for the years 2004 through 2009. Water temperatures in the UT Basin generally peak in July and August, cool down during September and October, stay near freezing from November through April, and then warm up during May and June.

Since water temperatures remain near freezing during the winter season, there is obviously greater variability in water temperatures during the summer. For July and August:

- Average monthly temperatures in the mainstem UT (not including tributaries) ranged from 5.6ºC at Hydrology Gage UT100E in UT-G in July and August 2007 to 13.1ºC at Hydrology Gage UT100D in UT-F in August 2004 (Table 3).
- Average daily temperatures ranged from 4.7ºC at Hydrology Gage UT100E in UT-G in August 2004 to 16.0ºC at Hydrology Gage UT100D in UT-F in August 2004 (Attachments 5 and 6).
- Instantaneous temperatures ranged from 3.6ºC at Hydrology Gage UT100E in UT-G in August 2004 and July 2007 to 18.8ºC at Hydrology Gage UT100D in UT-F in August 2004 (Attachments 5 and 6).

Generally speaking, water temperatures would be expected to increase in the downstream direction in a stream because air temperatures generally increase in the downstream direction (with decreasing elevations). However, exceptions to these expected trends may occur when the stream receives input from a source of relatively cold water (surface water and/or groundwater).

Longitudinal trends of maximum instantaneous, daily average, and minimum instantaneous water temperatures in the NFK are illustrated on Figure 10 for late summer (August 29, 2007) and late fall (October 15, 2007) conditions. On August 29, 2007, there were two reaches where the water temperatures became cooler: the downstream portion of UT-F (downstream from hydrology gage UT100D); and in UT-D. In contrast, water temperatures on October 15, 2007, showed a slight warming trend from upstream to downstream reaches, with slight decreases in UT-F and UTE.

On August 29, 2007, the flow and water temperature at hydrology gage UT100D were 0.39 cms and 10.8ºC, respectively (Chapter 7 and Attachment 5, respectively). On the same day, the flow and water

temperature at hydrology gage UT100C2 were 1.35 cms and 8.7ºC, respectively. Between UT100D and UT100C2, the river gained 0.96 cms and cooled down a total of 2.1ºC.

One of the sources of inflow to UT between UT100D and UT100C2 was Tributary UT 1.350. On August 29, 2007, the flow and water temperature at hydrology gage UT135A in UT-1.350 were 0.57 cms and 12.4ºC, respectively (Chapter 7 and Attachment 5, respectively). This suggests that the remaining additional inflow to the UT between UT100D and UT100C2 on August 29, 2007, of 0.39 cms was relatively cool water. This suggests groundwater inflow to UT in the downstream portion of UT-F (downstream from hydrology gage UT100D).

On August 29, 2007, the flow and water temperature at hydrology gage UT100C1 were 1.64 cms and 11.8ºC, respectively (Chapter 7 and Attachment 5, respectively). On the same day, the flow and water temperature at USGS gage UT100B (USGS Gage No. 15300250) were 3.54 cms and 8.0ºC, respectively. Between UT100C1 and UT100B, the river gained 1.90 cms and cooled down a total of 3.8ºC.

One of the sources of inflow to UT between UT100C1 and UT100B was Tributary UT 1.190. On August 29, 2007, the flow and water temperature at hydrology gage UT119A in UT 1.190 were 0.67 cms and 5.8ºC, respectively. The very cool temperatures in this tributary indicate that it is fed by groundwater, and this accounts for some of the cooling between UT100C1 and UT100B. Other sources of inflow to UT between UT100C1 and UT100B provide additional cooling, which suggests additional groundwater input.

1.5 EVALUATION OF SELECTED MODELING PERIOD

The ice-free portion of 2007 was selected for development of SNTEMP models of the SFK, NFK, and UT because the spatial coverage of measured water temperatures was greater in this year than it was in 2004, 2005, and 2006. Historical air temperature measurements from 58 years of record at Iliamna Airport were analyzed to determine how 2007 compared with long-term records.

The annual total of cumulative degrees-days above freezing was calculated for each of the 58 years of air temperature measurements at Iliamna Airport. A cumulative frequency analysis of these annual totals was performed, and the results of this analysis are shown on Figure 11. The following five different classifications of summer ice-free periods were developed, based on percent exceedences:

- Warm – 0 to 20 percent exceedence
- Somewhat warm – 20 to 40 percent exceedence
- Moderate – 40 to 60 percent exceedence
- Somewhat cool – 60 to 80 percent exceedence
- Cool – 80 to 100 percent exceedence

Recent years were examined to see how they would fit in this classification scheme. The years 2004 and 2005 were warm; the years 2007 and 2009 were somewhat warm; the year 2006 was moderate; and the year 2008 was cool. Thus, the year selected for SNTEMP modeling, 2007, is somewhat warm when compared with long-term records.

While this appendix is primarily focused on aquatic thermal regimes during summer ice-free periods, a similar assessment can be performed with historical air temperatures measured at Iliamna Airport to characterize how cold historical winter seasons were.

The annual total of cumulative degrees-days below freezing was calculated for each of the 57 years of air temperature measurements at Iliamna Airport during winter periods. A cumulative frequency analysis of these annual totals was performed, and the results of this analysis are shown on Figure 12. The following five different classifications of winter periods were developed, based on percent exceedence:

- Cool – 0 to 20 percent exceedence
- Somewhat cool – 20 to 40 percent exceedence
- Moderate – 40 to 60 percent exceedence
- Somewhat warm – 60 to 80 percent exceedence
- Warm – 80 to 100 percent exceedence

Recent years were examined to see how they would fit in this classification scheme. The winter periods of 2006/2007 and 2008/2009 were cool; the winter period 2005/2006 was somewhat cool; the winter period 2007/2008 was moderate; and the winter period 2004/2005 was warm.

While the prediction of river ice thickness would be complicated by the effects of groundwater flow in the SFK, NFK, and UT, some simplistic calculations can be performed using the modified Stefan equation (USACE, 2002). According to this method, the maximum ice thickness in a stream depends on the cumulative degree-days below zero each winter.

A cumulative frequency analysis of maximum winter ice thickness was performed, and the results of this analysis are shown on Figure 13. The range of ice thicknesses depicted on Figure 13 does not account for the complicating effects of relatively warm groundwater inflow during the winter season. Indeed, some portions of the SFK, NFK, and UT have been observed to remain ice-free during the winter season.

2. METHODS

2.1 FIELD DATA COLLECTION

2.1.1 INSTREAM WATER TEMPERATURE

Continuous instream water temperatures have been measured in study area rivers at various locations and various time periods since 2004-2009, with intervals ranging from 1 minute to 2 hours. Water temperatures have been monitored at the following three types of stations:

- Pebble Project hydrology gaging stations – These continuous stations monitor both stage and water temperature. The names of these stations start with the prefixes “SK,” “NK,” or “UT” for the SFK Basin, NFK Basin, or UT Basin, respectively. Water temperatures at these stations have been measured primarily during summer ice-free periods since 2004-2009. Water temperatures

have been collected and compiled from 2004 through 2007 from seven sites in the SFK Basin, five sites in the NFK Basin, and seven sites in the UT Basin.

- Pebble Project water temperature monitoring stations – These continuous stations monitor water temperature. The names of these stations start with the prefixes "SFK," "NFK," or "UT" for the SFK Basin, NFK Basin, or UT Basin, respectively. Water temperatures at these stations have been monitored year-round using Onset Hobo Pendant monitors. In August 2007, 29 of these stations were initially installed. In October 2008, nine more stations were added to the network. There are now 11 sites in the SFK Basin, 13 sites in the NFK Basin, and 14 sites in the UT Basin.
- USGS hydrology gaging stations – These continuous stations monitor both stage and water temperature. The USGS gaging stations on the SFK, NFK, and UT are named SK100B (USGS Gage No. 15302200), NK100A (USGS Gage No. 15302250), and UT100B (USGS Gage No. 15300250), respectively. Water temperatures from these stations have been compiled and reported from July 2006 through September 2008.

During site visits to download data from the Pebble water temperature recorders, water temperature was measured with a thermometer as a quality assurance (QA)/quality control (QC) check. The water temperature and time of day were recorded in a field book.

Pebble water temperature monitors were installed within a protective housing of polyvinyl chloride (PVC) pipe (Photo 1). The PVC pipe was tethered to a steel cable that was anchored to the top of the streambank. During data retrieval in October 2008, it was necessary to use a sledge hammer to free the temperature monitor from below the ice surface (Photo 2). No instruments were damaged as a result of these activities.

2.1.2 AIR TEMPERATURE

Continuous air temperatures were also measured at six sites established near a corresponding water temperature site. These air temperature-monitoring sites include two on the SFK (SFK100FAT and SFK4AT), one on the NFK (NFK100A1AT), and three on the UT (UT100EAT, UT100C1AT, and UT3AT).

During site visits to download data from the corresponding water temperature site, air temperature data were also downloaded from the air temperature recorder. Air temperature was also measured with a thermometer as a QA/QC check. The air temperature and time of day were recorded in a fieldbook.

2.1.3 RIPARIAN SHADE

During each site visit to download data from the instream water temperature recorders, additional data were collected to characterize riparian shade. Riparian vegetation influences heat input from sunshine in the SNTEMP model by providing shade for the stream. The riparian vegetation data needed for input to the SNTEMP model were derived from field observations, site photographs, and reviewing available orthophotographs.

The shade from riparian vegetation was modeled in the SNTEMP model by specifying various parameters to characterize the riparian community. These parameters include the following:

- Vegetation Height – average maximum height of the overstory riparian vegetation above the water surface.
- Vegetation Crown Width – average of the maximum diameter of the riparian vegetation adjacent to the stream.
- Vegetation Offset – average distance of tree trunks from the water surface.
- Vegetation Density – ratio that quantifies the effective shading provided by the riparian vegetation (ranges from 0 to 1).

While the SNTEMP model is capable of modeling shade from trees and other riparian vegetation, it is recognized that the NFK, the SFK, and the upstream portion of UT (Reach Segments UT-C, UT-D, UT-E, UT-F, and UT-G) generally lack trees along their streambanks. Input to the SNTEMP model was specified in these areas to account for the lack of shade from trees, and to account for the shade provided by other riparian vegetation. The lower portion of the UT (Reach Segments UT-A and UT-B) does have trees along the streambanks (Photo 3), and appropriate riparian shade parameters were selected to account for the shade provided by these trees.

2.2 REVIEW AVAILABLE DATA OBTAINED FROM OTHER STUDIES/DATA SOURCES

Data were obtained from other studies and data sources, and QA/QC checked prior to incorporation in the SNTEMP model. Types of data included hydrologic data, meteorological data, river/valley morphology, and seasonal thermal characteristics.

2.2.1 HYDROLOGIC DATA

The SNTEMP models described herein relied on continuous flow records from the summer ice-free period of 2007 measured at 19 stations. The stations included:

- SFK – five stations on the mainstem (SK100F, SK100C, SK100B1, SK100B, and SK100A) and one on a tributary (SK119A; Figure 14).
- NFK – four stations on the mainstem (NK100C, NK100B, NK100A1, and NK100A) and one on a tributary (NK119A; Figure 15).
- UT – six stations on the mainstem (UT100E, UT100D, UT100C2, UT100C1, UT100C, and UT100B) and two on tributaries (UT119A and UT135A; Figure 16).

Additional hydrology nodes shown on Figures 14, 15, and 16 represent locations where flows were interpolated (or extrapolated) in the model.

2.2.2 METEOROLOGICAL DATA

The types of meteorological data required by the SNTEMP model include air temperature, relative humidity, wind speed, and sunshine ratio. These data were obtained from six meteorological stations established for the Pebble Project: (Figure 1): Pebble 1, Pebble 3, Pebble 4, Pebble 5, Pebble 5A, and Pebble 6. Of these six stations, Pebble 1 has the longest period of record (Hoefler, 2006, 2008a, and

2008b) and is centrally located near the headwaters of all three study basins. As a result, meteorological records from the Pebble 1 station were used for development of a SNTEMP model for each of the three basins.

2.2.2.1 AIR TEMPERATURE

Daily average air temperatures at the Pebble 1 station are shown on Figure 17 for the period from May 17 to October 5, 2007, the period selected for development of SNTEMP models. Daily average air temperatures during this period ranged from 0.5ºC on October 5, 2007, to 17.5ºC on August 13, 2007. Air temperatures generally increase with a decrease in elevation. This is accounted for in the SNTEMP model by using the default Moist-Air Adiabatic Lapse Rate (MALR) of 0.00656ºC per meter. Air temperature records from the Pebble 1 station were compared with air temperature records from the nearby Iliamna Airport to check the default rate used in the SNTEMP model.

The ground elevation at Pebble 1 meteorological station is 474.0 meters (1,555 feet, derived from 10-foot contours). The ground elevation at Iliamna Airport is 55.8 meters (183 feet, from United States National Climatic Data Center). The difference in elevation between these two locations is 418.2 meters. The average air temperature at Pebble 1 meteorological station was 8.7ºC from May 17 to October 5 2007. The corresponding average air temperature at Iliamna Airport was 11.3ºC. The difference in air temperature between these two locations was 2.6ºC. So, a difference in temperature of 2.6ºC was observed between two nearby locations with a difference in elevation of 418.2 meters. This is equivalent to a lapse rate of 0.0062ºC per meter, very similar to the default lapse rate used in the SNTEMP model.

2.2.2.2 RELATIVE HUMIDITY

Daily average relative humidity data at the Pebble 1 station are shown on Figure 18 for the period from May 17 to October 5, 2007, the period selected for development of SNTEMP models. Daily average relative humidity during this period ranged from 56 percent on June 20, 2007, to 100 percent on July 22, July 23, and August 4, 2007. The average relative humidity was 85 percent from May 17 to October 5, 2007. Relative humidity values for other sites were determined from the ideal gas law (Clapeyron, 1834).

2.2.2.3 WIND SPEED

Daily average wind speeds at the Pebble 1 station are shown on Figure 19 for the period from May 17 to October 5, 2007, the period selected for development of the SNTEMP models. Daily average wind speeds during this period ranged from 2.2 meters per second (m/s) on September 2, 2007, to 20.8 m/s on September 11, 2007. The average wind speed was 6.5 m/s from May 17 to October 5, 2007.

2.2.2.4 SOLAR RADIATION

Daily solar radiation measured at Pebble 1 station is shown on Figure 20 for the period from May 17 to October 5, 2007, the period selected for development of the SNTEMP models. Daily solar radiation during this period ranged from 13 Langleys on October 4, 2007, to 318 Langleys on June 15, 2007. The average daily solar radiation was 141 Langleys from May 17 to October 5, 2007.

The SNTEMP model also requires that a ground temperature be specified. For this parameter, the default value of ground temperature (average annual air temperature) was assumed for the temperature models developed for the SFK, NFK, and UT.

2.2.3 RIVER/VALLEY MORPHOLOGY

In the SNTEMP model, river and valley morphology influences heat input from sunshine, orographic adjustments to meteorological conditions, and travel time through the study reach. Thus, it was necessary to specify a number of factors related to the morphological characteristics of the river and valley, including the following:

- Longitudinal Profile – needed to perform orographic adjustments to meteorological conditions and to calculate travel time. This was derived from contour maps with 3.048-meter (10-foot) intervals.
- Latitude – needed to calculate heat input from sunshine. This was derived from orthophotographs incorporated into the Geographic Information System (GIS) database.
- Stream Reach Alignment (Azimuth) – needed to calculate heat input from sunshine. This was derived from orthophotographs incorporated into the GIS database.
- Channel Width – needed to calculate heat input from sunshine and to determine travel time. This was determined from channel cross-sections and stage/discharge ratings curves obtained from fluvial geomorphology study sites throughout the study reaches.
- Topographic Altitude (Lateral Valley Slope) – specified for both sides of the river and needed to calculate heat input from sunshine. This was derived from contour maps with 3.048-meter (10-foot) intervals.
- Channel Roughness (Manning's "n") – used to calculate diurnal range of water temperatures.

2.2.4 SEASONAL THERMAL CHARACTERISTICS

The SNTEMP model allows some parameters to be specified on a seasonal basis. These parameters include the dust coefficient, ground reflectivity (seasonally adjusted to account for snow cover in the winter season) and calibration factors for air temperature and wind speed. Appropriate values based on project characteristics were selected for these parameters.

2.3 STREAM TEMPERATURE MODEL DEVELOPMENT

The SNTEMP model is used to simulate heat transfer processes in a river network (mainstem and tributaries) where a steady-state solution was determined within each computational time step. Within this section, the river networks developed for the SFK, NFK, and UT are described and the rational for the computational time step discussed.

2.3.1 MODEL STRUCTURE

The structure of the SNTEMP model developed for each of the three study rivers was based on: computational nodes established to define the upstream and downstream end of the study river, the

confluence of major tributaries, the locations of hydrology gages, and locations where temperatures have been measured in each river.

2.3.2 COMPUTATIONAL TIME STEP

The computational time step used in the SNTEMP model should not exceed the travel time from the most upstream location in the study river to the most downstream location. The computational time step should also be as small as possible during the time of year when water temperatures are coolest, because this is a period with potential to impact eggs and newly hatched fish prior to emergence.

Travel time through a study river was determined from flow velocity/discharge relationships developed for the main-channel PHABSIM study sites, as well as flow velocity/discharge relationships derived from data collected at USGS gaging stations.

2.4 STREAM TEMPERATURE MODEL CALIBRATION

The SNTEMP models developed for the SFK, NFK, and UT were calibrated to ensure that predicted instream water temperatures matched observed water temperatures during periods with concurrent water temperature, meteorological, and hydrologic records. Typical input variables that were adjusted during the calibration process include wind speed, temperature of accretion flows (surface water and groundwater), and Manning's "n".

3. SNTEMP MODEL OF THE SOUTH FORK KOKTULI RIVER

3.1 MODEL STRUCTURE AND COMPUTATIONAL TIME STEP

The overall structure of the SNTEMP model used to analyze the SFK was defined by hydrology nodes, stream geometry nodes, and confluence nodes (Figure 14). Thirty-four nodes were used to construct the stream temperature model, consisting of the following:

- Hydrology Gage SK100F – RK 54.67 in SFK-D, just downstream from Frying Pan Lake.
- Stream Geometry Node SFKSG1 – RK 53.32 in SFK-D.
- Stream Geometry Node SFKSG2 – RK 51.22 in SFK-C.
- Hydrology Node SK100LF2 – RK 51.09 in SFK-C.
- Stream Geometry Node SFKSG3 – RK 49.41 in SFK-C.
- Stream Geometry Node SFKSG4 – RK 47.56 in SFK-C.
- Stream Geometry Node SFKSG5 – RK 45.71 in SFK-C.
- Stream Geometry Node SFKSG6 – RK 44.81 in SFK-C.
- Stream Geometry Node SFKSG7 – RK 43.94 in SFK-C.
- Hydrology Node SK100LF4 – RK 43.64 in SFK-C.
- Stream Geometry Node SFKSG8 – RK 41.08 in SFK-C.

- Stream Geometry Node SFKSG9 – RK 39.97 in SFK-C.
- Stream Geometry Node SFKSG10 – RK 38.36 in SFK-C.
- Hydrology Gage SK100C – RK 34.81 in SFK-C.
- Hydrology Gage SK119A – Located on Tributary SFK 1.190, 1.79 kilometers upstream from the confluence with the SFK (RK 34.28 in SFK-B).
- Confluence of the SFK and Tributary SFK 1.190 – RK 34.26 in SFK-B.
- Stream Geometry Node SFKSG11 – RK 34.14 in SFK-B.
- Hydrology Node SK100LF6 – RK 34.12 in SFK-B.
- Hydrology Gage SK100B1 – RK 29.26 in SFK-B.
- Stream Geometry Node SFKSG12 – RK 27.58 in SFK-B.
- Stream Geometry Node SFKSG13 – RK 25.10 in SFK-B.
- Hydrology Gage SK100B – RK 24.90 in SFK-B.
- Stream Geometry Node SFKSG14 – RK 21.85 in SFK-A.
- Stream Geometry Node SFKSG15 – RK 20.08 in SFK-A.
- Stream Geometry Node SFKSG16 – RK 15.36 in SFK-A.
- Hydrology Node FRS-3 – RK 13.91 in SFK-A.
- Stream Geometry Node SFKSG17 – RK 12.51 in SFK-A.
- Stream Geometry Node SFKSG18 – RK 9.23 in SFK-A.
- Stream Geometry Node SFKSG19 – RK 7.89 in SFK-A.
- Stream Geometry Node SFKSG20 – RK 5.10 in SFK-A.
- Hydrology Node FRS-2 – RK 2.97 in SFK-A.
- Stream Geometry Node SFKSG21 – RK 2.13 in SFK-A.
- Hydrology Gage SK100A – RK 0.11 in SFK-A.
- Confluence of the SFK and NFK – RK 0.00 in SFK-A.

The time step utilized in SNTEMP must be 1 day or greater. Based on the total reach length of the SFK model of 54.67 kilometers, a time step of 1 day was selected. A travel time of 1 day would be equivalent to a travel velocity of 0.6 m/s.

3.2 HYDROLOGIC DATA

Daily flows at Hydrology Gages SK100A, SK100B, SK100B1, SK100C, and SK100F are shown on Figure 21, as well as estimated flows in the SFK just downstream from the confluence with Tributary SFK 1.190, for the period from May 17 to October 5, 2007. Flow records from Hydrology Gage SK100C indicate that there was no flow in the SFK near the downstream end of SFK-C on five different occasions, for a total of 40 days during the summer ice-free period of 2007.

3.3 RIVER AND VALLEY MORPHOLOGY

A longitudinal profile of the SFK is shown on Figure 22. The average gradient over the SFK is 0.2 percent. Within SFK-C, there is a portion of the river with a very mild gradient (0.05 percent) that extends from RK 37.8 to RK 43.5.

The rate of heat exchange at the water surface is controlled by the wetted width of the channel. The SNTEMP model simulates wetted width as a function of flow. Channel width data were obtained from the fluvial geomorphology investigations (Appendix 15.1F). The wetted widths in the SFK simulated in the SNTEMP model under relatively high (October 5, 2007) and low (August 1, 2007) flow conditions are shown on Figure 23. There is a significant increase in wetted width at the transition from SFK-C to SFK-B.

The alignment of the river valley plays a role in how much shade is provided by the valley morphology. The valley alignment is specified in the SNTEMP model by using azimuth, as shown for the SFK on Figure 24. The valley is aligned in a North/South direction when the azimuth is zero, and the valley is aligned in an East/West direction when the azimuth is plus or minus 90 degrees.

The SFK receives more shade from the surrounding terrain in the upstream portions of the river and less shade in the downstream portions. This was accounted for in the SNTEMP model by specifying a lateral valley slope. A lateral valley slope of 5.7 degrees was applied from RK 0.00 to 25.10. In the next reach extending from RK 25.10 to 51.22, a lateral valley slope of 11.4 degrees was applied. In the most upstream reach of the SFK (RK 51.22 to 54.67), a lateral valley slope of 17.1 degrees was applied.

3.4 RIPARIAN SHADE

The height, crown measurement, and offset of the riparian vegetation for the SFK SNTEMP model were specified to be 2.0, 1.5, and 0.0 meters, respectively. Seasonal variation in riparian vegetation density was assumed to range from 40 to 60 percent.

3.5 MODEL CALIBRATION

Input to the SNTEMP model included measured average daily water temperatures in the SFK at Hydrology Gage SK100F and in Tributary SFK 1.190 at Hydrology Gage SK119A from May 17 to October 5, 2007 (Figure 25). Average daily water temperatures from lateral accretion sources (surface water and/or groundwater) were used to calibrate the SNTEMP model. Assumed water temperatures from lateral accretion sources are shown on Figure 26 for SFK reaches extending from RK 0.00 to 29.26, from RK 29.26 to 35.81, and from RK 35.81 to 54.67. The warmest assumed accretion flows were in the upstream SFK reach extending from RK 35.81 to 54.67, and the coolest assumed accretion flows were in the middle reach extending from RK 29.26 to 35.81.

Measured average daily water temperatures were compared with model predicted average daily water temperatures in the SFK at Hydrology Gages SK100A, SK100B1, and SK100C (Figures 27, 28, and 29, respectively). In general, there was perfect agreement between measured and predicted water temperatures at the most downstream hydrology gage (SK100A) and very good agreement at the Hydrology Gage SK100B1. Further upstream, there is still good agreement between measured and

predicted water temperatures at Hydrology Gage SK100C. However, the simulation of water temperatures at Hydrology Gage SK100C is complicated by the loss of flow upstream from this gage under low flow conditions.

Input files for the calibrated SNTEMP model of the SFK are provided in Attachment 7, and output files from the calibrated SNTEMP model of the SFK are provided in Attachment 8.

4. SNTEMP MODEL OF THE NORTH FORK KOKTULI RIVER

4.1 MODEL STRUCTURE AND COMPUTATIONAL TIME STEP

The overall structure of the SNTEMP model used to analyze the NFK is defined by the following 31 hydrology, stream geometry, and confluence nodes (Figure 15):

- Headwater of the NFK – RK 57.67 in NFK-F.
- Stream Geometry Node NFKSG1 – RK 55.75 in NFK-F.
- Stream Geometry Node NFKSG2 – RK 48.17 in NFK-D.
- Stream Geometry Node NFKSG3 – RK 44.77 in NFK-D.
- Stream Geometry Node NFKSG4 – RK 42.08 in NFK-D.
- Stream Geometry Node NFKSG5 – RK 41.23 in NFK-D.
- Stream Geometry Node NFKSG6 – RK 39.77 in NFK-D.
- Stream Geometry Node NFKSG7 – RK 38.55 in NFK-D.
- Hydrology Gage NK100C – RK 36.76 in NFK-D.
- Stream Geometry Node NFKSG8 – RK 36.53 in NFK-C.
- Hydrology Gage NK119A – Located on Tributary NFK 1.190, 1.84 kilometers upstream from the confluence with the NFK (RK 36.52 in NFK-C).
- Confluence of the NFK and Tributary NFK 1.190 – RK 36.52 in NFK-C.
- Hydrology Gage NK100B – RK 35.75 in NFK-C.
- Stream Geometry Node NFKSG9 – RK 35.38 in NFK-C.
- Stream Geometry Node NFKSG10 – RK 33.97 in NFK-C.
- Stream Geometry Node NFKSG11 – RK 30.99 in NFK-C.
- Stream Geometry Node NFKSG12 – RK 28.48 in NFK-C.
- Hydrology Node NK100LF3 – RK 27.93 in NFK-C.
- Stream Geometry Node NFKSG13 – RK 26.95 in NFK-C.
- Stream Geometry Node NFKSG14 – RK 24.52 in NFK-C.
- Stream Geometry Node NFKSG15 – RK 16.03 in NFK-B.

- Stream Geometry Node NFKSG16 – RK 13.83 in NFK-B.
- Hydrology Gage NK100A1 – RK 13.70 in NFK-B.
- Stream Geometry Node NFKSG17 – RK 11.57 in NFK-A.
- Stream Geometry Node NFKSG18 – RK 9.89 in NFK-A.
- Hydrology Node FRS-4 – RK 9.31 in NFK-A.
- Stream Geometry Node NFKSG19 – RK 7.56 in NFK-A.
- Stream Geometry Node NFKSG20 – RK 6.19 in NFK-A.
- Hydrology Gage NK100A – RK 5.27 in NFK-A.
- Stream Geometry Node NFKSG21 – RK 3.52 in NFK-A.
- Confluence of the NFK and SFK – RK 0.00 in NFK-A.

The time step utilized in SNTEMP must be 1 day or greater. Based on the total reach length of the NFK model of 57.67 kilometers, a time step of 1 day was selected. A travel time of 1 day would be equivalent to a travel velocity of 0.7 m/s.

4.2 HYDROLOGIC DATA

Daily flows at Hydrology Gages NK100A, NK100A1, NK100B, and NK100C are shown on Figure 30, as well as estimated flows in the NFK headwaters (RK 57.67), for the period from May 18 to October 5, 2007.

4.3 RIVER AND VALLEY MORPHOLOGY

A longitudinal profile of the NFK is shown on Figure 31. The average gradient in NFK-A, NFK-B, and NFK-C is 0.4 percent. The gradient in NFK-D is relatively mild (0.2 percent). Steeper gradients are found in NFK-E and NFK-F (0.8 percent and 6.6 percent, respectively).

The rate of heat exchange at the water surface is controlled by the wetted width of the channel. The SNTEMP model simulates wetted width as a function of flow. Channel width data were obtained from fluvial geomorphology investigations (Appendix 15.1F). The wetted widths in the NFK simulated in the SNTEMP model under relatively high (October 5, 2007) and low (August 2, 2007) flow conditions are shown on Figure 32.

The alignment of the river valley plays a role in how much shade is provided by the valley morphology. The valley alignment is specified in the SNTEMP model by using azimuth, as shown for the NFK on Figure 33. The valley is aligned in a North/South direction when the azimuth is zero, and the valley is aligned in an East/West direction when the azimuth is plus or minus 90 degrees.

The NFK receives more shade from the surrounding terrain in the upstream portions of the river and less shade in the downstream portions. This was accounted for in the SNTEMP model by specifying a lateral valley slope. A lateral valley slope of 5.7 degrees was applied from RK 0.00 to 13.83. In the next reach extending from RK 13.83 to 55.75, a lateral valley slope of 11.4 degrees was applied. In the most upstream reach extending from RK 55.75 to 57.67, a lateral valley slope of 17.1 degrees was applied.

4.4 RIPARIAN SHADE

The height, crown measurement, and offset of the riparian vegetation for the NFK SNTEMP model were specified to be 2.0, 1.5, and 0.0 meters, respectively. Seasonal variation in riparian vegetation density was assumed to range from 40 to 60 percent.

4.5 MODEL CALIBRATION

Input to the SNTEMP model included estimated average daily water temperatures in the NFK at the headwaters (RK 57.67) and measured average daily water temperatures in Tributary NFK 1.190 at Hydrology Gage NK119A from May 18 to October 5, 2007 (Figure 34). Average daily water temperatures from lateral accretion sources (surface water and/or groundwater) were used to calibrate the SNTEMP model. Assumed water temperatures from lateral accretion sources are shown on Figure 35 for NFK reaches extending from: RK 0.00 to 13.70, RK 13.70 to 35.75, RK 35.75 to 36.76, and RK 36.76 to 57.67. The warmest assumed accretion flows were in the upstream reach extending from RK 36.76 to 57.67, and the coolest assumed accretion flows were in the reach extending from RK 13.70 to 35.75.

Measured average daily water temperatures are compared with predicted average daily water temperatures in the NFK at Hydrology Gages NK100A, NK100A1, NK100B, and NK100C (Figures 36, 37, 38, and 39, respectively). There is generally good agreement between measured and predicted water temperatures at all four of these gage sites.

Input files for the calibrated SNTEMP model of the NFK are provided in Attachment 9, and output files from the calibrated SNTEMP model of the NFK are provided in Attachment 10.

5. SNTEMP MODEL OF UPPER TALARIK CREEK

5.1 MODEL STRUCTURE AND COMPUTATIONAL TIME STEP

The overall structure of the SNTEMP model used to analyze the UT was defined by of total of 30 nodes consisting of hydrology, stream geometry, and confluence nodes (Figure 16). These nodes, listed from upstream to downstream, consisted of the following:

- Headwater of the UT – RK 62.38 in UT-G.
- Hydrology Gage UT100E – RK 59.97 in UT-G.
- Stream Geometry Node UTSG1 – RK 59.66 in UT-G.
- Stream Geometry Node UTSG2 – RK 56.48 in UT-F.
- Stream Geometry NodeUTSG3 – RK 55.40 in UT-F.
- Stream Geometry Node UTSG4 – RK 51.86 in UT-F.
- Hydrology Gage UT100D – RK 51.62 in UT-F.
- Stream Geometry Node UTSG5 – RK 45.91 in UT-F.

- Hydrology Gage UT135A – Located on Tributary UT 1.350, 1.32 kilometers upstream from the confluence with the UT (RK 45.05 in UT-E).
- Confluence of the UT and Tributary UT 1.350 – RK 45.05 in UT-E.
- Hydrology Gage UT100C2 – RK 44.63 in UT-E.
- Stream Geometry Node UTSG6 – RK 38.36 in UT-E.
- Hydrology Gage UT100C1 – RK 37.64 in UT-E.
- Stream Geometry Node UTSG7 – RK 35.82 in UT-D.
- Stream Geometry Node UTSG8 – RK 32.95 in UT-D.
- Stream Geometry Node UTSG9 – RK 32.34 in UT-D.
- Hydrology Gage UT100C – RK 29.31 in UT-D.
- Stream Geometry Node UTSG10 – RK 27.15 in UT-D.
- Stream Geometry Node UTSG11 – RK 25.04 in UT-D.
- Hydrology Gage UT119A – Located on Tributary UT 1.190, 0.32 kilometers upstream from the confluence with the UT (RK 24.74 in UT-C).
- Confluence of the UT and Tributary UT 1.190 – RK 24.74 in UT-C.
- Hydrology Gage UT100B – RK 24.50 in UT-C.
- Stream Geometry Node UTSG12 – RK 20.81 in UT-C.
- Stream Geometry Node UTSG13 – RK 18.81 in UT-C.
- Stream Geometry Node UTSG14 – RK 14.60 in UT-B.
- Hydrology Gage UT100APC1 – RK 14.36 in UT-B.
- Hydrology Gage UT100APC2 – RK 9.85 in UT-B
- Stream Geometry Node UTSG15 – RK 9.12 in UT-B.
- Hydrology Gage UT100APC3 – RK 2.24 in UT-A.
- Mouth of the UT (Iliamna Lake) – RK 0.00 in UT-A.

Note: Flows at Hydrology Gages UT100APC1, UT100APC2, and UT100APC3 were estimated prior to August 20-21, 2007 when initial data collection began.

The time step utilized in the SNTEMP model must be 1 day or greater. Based on the total reach length of the model of the UT (62.38 kilometers), a time step of 1 day was selected for the model. A travel time of 1day would be equivalent to a travel velocity of 0.7 m/s.

5.2 HYDROLOGIC DATA

Daily flows at Hydrology Gages UT100B, UT100C, UT100C2, and UT100D are shown on Figure 40, as well as estimated flows in the UT at the mouth and at the headwaters, for the period from May 17 to October 5, 2007.

5.3 RIVER AND VALLEY MORPHOLOGY

A longitudinal profile of the UT is shown on Figure 41. The average gradient for UT-A through UT-F is 0.4 percent. The gradient is steeper in UT-G (1.7 percent).

The rate of heat exchange at the water surface is controlled by the wetted width of the channel. The SNTEMP model simulates wetted width as a function of flow. Channel width data were obtained from fluvial geomorphology investigations (Appendix 15.1F). The wetted widths in the UT simulated in the SNTEMP model under relatively high (October 5, 2007) and low (August 1, 2007) flow conditions are shown on Figure 42.

The alignment of the river valley plays a role in how much shade is provided by the valley morphology. The valley alignment is specified in the SNTEMP model by using azimuth, as shown for the UT on Figure 43. The valley is aligned in a North/South direction when the azimuth is zero, and the valley is aligned in an East/West direction when the azimuth is plus or minus 90 degrees.

The UT receives more shade from the surrounding terrain in the upstream portions of the river and less shade in the downstream portions. This was accounted for in the SNTEMP model by specifying a lateral valley slope. A lateral valley slope of 5.7 degrees was applied from RK 0.00 to 16.81. In the next reach extending from RK 16.81 to 59.13, a lateral valley slope of 11.4 degrees was applied. In the most upstream UT reach (RK 59.13 to 62.38), a lateral valley slope of 17.1 degrees was applied.

5.4 RIPARIAN SHADE

The riparian community in the downstream portion of the UT (RK 0.00 through RK 16.81) consists of a mix of willows and trees. In this portion of the UT, the height, crown measurement, and offset of the riparian vegetation were specified to be 4.0, 3.0, and 0.5 meters, respectively. Seasonal variation in riparian vegetation density was assumed to range from 40 to 60 percent.

The riparian community in the upstream portion of the UT (RK 16.81 through RK 62.38) consists primarily of willows. In this portion of the UT, the height, crown measurement, and offset of the riparian vegetation were specified to be 2.0, 1.5, and 0.0 meters, respectively. Seasonal variation in riparian vegetation density was assumed to range from 40 to 60 percent.

5.5 MODEL CALIBRATION

Input to the SNTEMP model included estimated average daily water temperatures in the UT at the headwaters (RK 62.38), and measured average daily water temperatures in Tributary UT 1.350 at Hydrology Gage UT135A and in Tributary UT 1.190 at Hydrology Gage UT119A from May 17 to October 5, 2007 (Figure 44). Average daily water temperatures from lateral accretion sources (surface water and/or groundwater) were used to calibrate the SNTEMP model. Assumed water temperatures from lateral accretion sources are shown on Figure 45 for reaches extending from: RK 0.00 to 29.31, RK 29.31 to 44.63, RK 44.63 to 51.62, and RK 51.62 to 62.38.

Measured average daily water temperatures were compared with predicted average daily water temperatures in the UT at Hydrology Gages UT100B, UT100C, UT100C2, and UT100D (Figures 46, 47,

48, and 49, respectively). There is generally good agreement between measured and predicted water temperatures at all four of the gage sites.

Input files for the calibrated SNTEMP model of the UT are provided in Attachment 11, and output files from the calibrated SNTEMP model of the UT are provided in Attachment 12.

6. WATER TEMPERATURES AT THE UPSTREAM END OF THE KOKTULI RIVER

A stream temperature model was not developed for the KR because water temperatures were not monitored in the KR; therefore, there were no data available for calibrating a model of the KR. Stream temperatures at the upstream end of the Koktuli River were estimated by combining the flows and water temperatures from the downstream ends of the SFK and NFK, and performing a simple mixing calculation.

Results of this calculation are shown on Figure 50. There is generally more flow in the NFK than there is in the SFK at the confluence, so the estimated water temperatures in the KR are closer to the water temperatures in the NFK than they are to water temperatures in the SFK.

8. GLOSSARY

Accretion flow – the addition of flow to a river from surface water (tributaries) or groundwater sources.

Azimuth – a compass direction measured by an angle with respect to the north/south alignment. A valley aligned in the north/south direction would have an azimuth of zero degrees. The azimuth increases in the clockwise direction, and decreases in the counter-clockwise direction. Thus, a valley with a northeast/southwest alignment would have an azimuth of 45 degrees while a valley with a northwest/southeast alignment would have an azimuth of -45 degrees.

Orographic - of or pertaining to the effects of mountains on weather. In particular, air temperature and barometric pressure generally decrease with increasing elevation.

Note:

— = Not available.

There are several reasons for missing data gaps. Hydrology gages (which are also used to measure temperature) are normally removed prior to winter freeze up, and reinstalled after the ice melts. Missing data gaps at other locations occurred when the memory limit of the monitor was reached before there was an opportunity to safely retrieve the data. Data gaps at some gages occurred when the water surrounding the monitor froze.

Estimated Water Temperatures at the Upstream End of the Koktuli River, May 17 to October 5, 2007

Note: Data derived from a mixing calculation of flow and water temperature at the downstream ends of the NFK and SFK.

PHOTOGRAPHS

PHOTO 1: Pebble water temperature recorders were installed within a protective housing of PVC pipe, and tethered to a steel cable that was anchored to the top of the streambank, July 2008.

PHOTO 2: Recovery of thermistors in October 2008 in the NFK required breaking the ice cover. No instruments were damaged as a result of these activities.

PHOTO 3: Shade provided by trees along the UT streambank at IFIM Site 08-UTC1-MS1, June 2008.

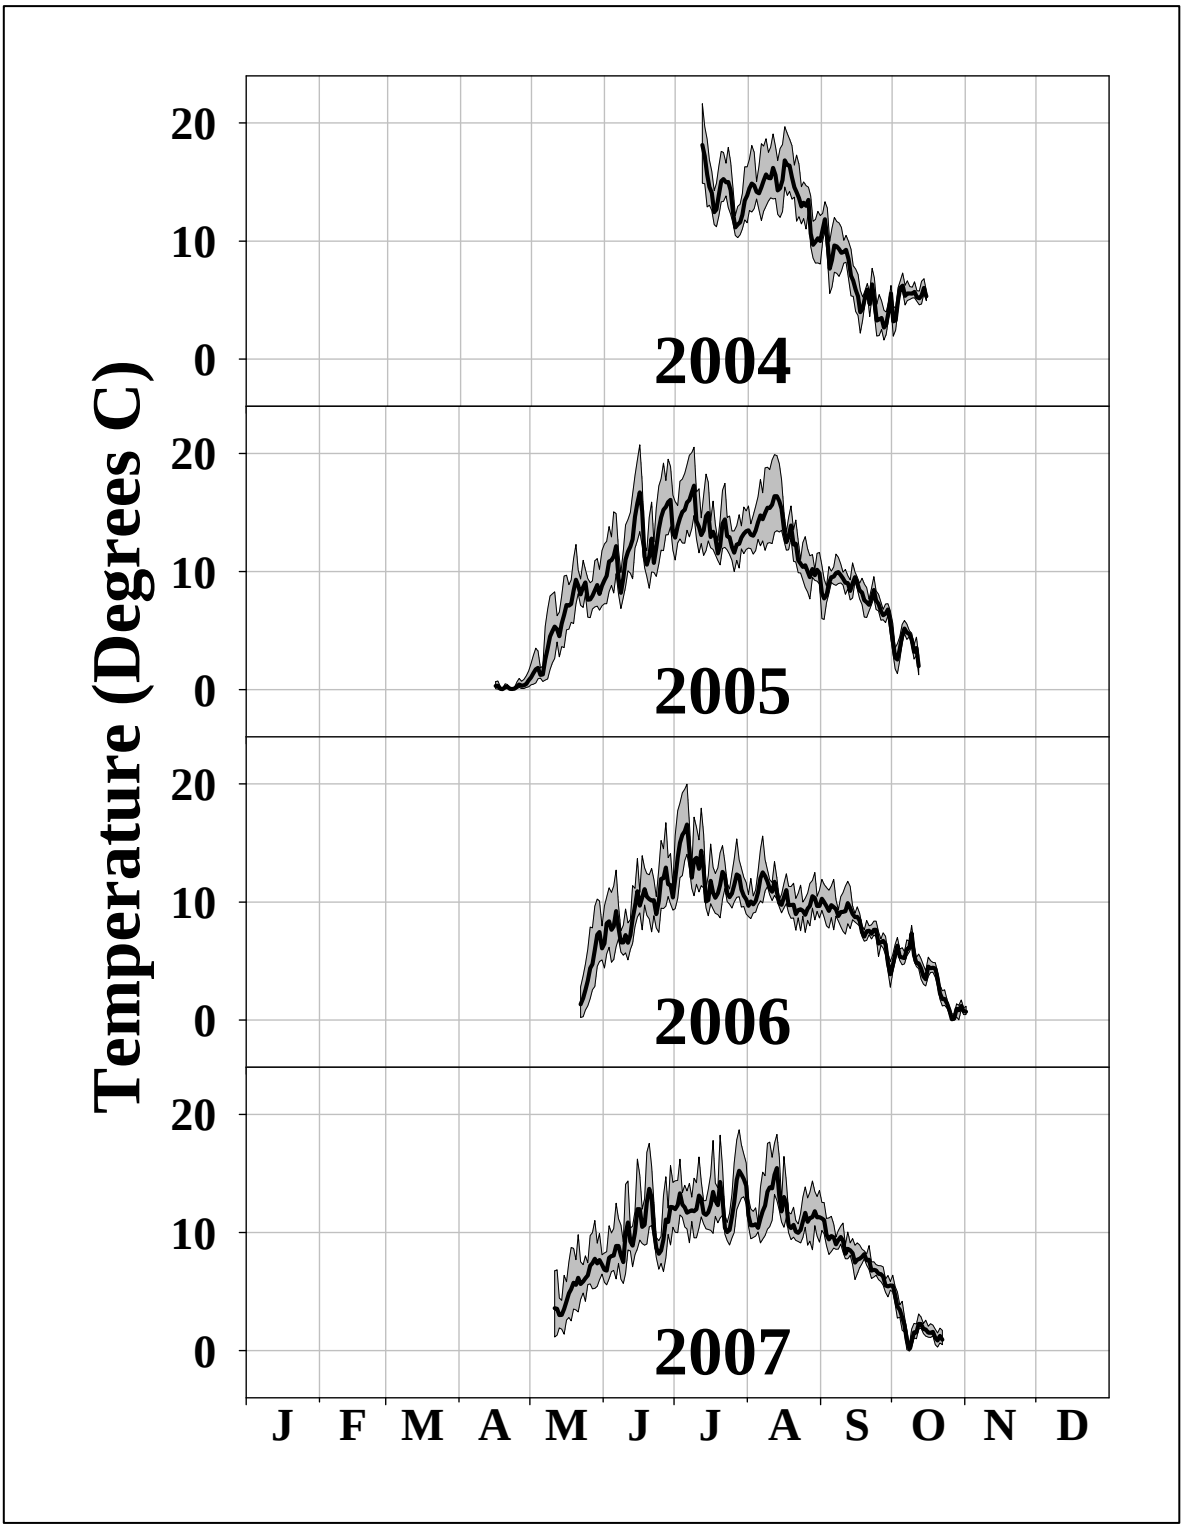
ATTACHMENTS

ATTACHMENT 1

SOUTH FORK KOKTULI RIVER THERMOGRAPHS, 2004 THROUGH 2007

Thermographs of Daily Maximum, Average, and Minimum Water Temperatures and Tables of Monthly Minimum Instantaneous, Minimum Daily, Monthly Average, Maximum Daily, and Maximum Instantaneous Water Temperatures at Hydrology and Water Temperature Monitoring Sites

Note: There are several reasons for missing data gaps in this attachment. Hydrology gages (which are also used to measure temperature) are normally removed prior to winter freeze up, and reinstalled after the ice melts. Missing data gaps at other locations occurred when the memory limit of the monitor was reached before there was an opportunity to safely retrieve the data. Data gaps at some gages occurred when the water surrounding the monitor froze.



Daily maximum, average, and minimum water temperatures in the South Fork Koktuli River at hydrology gage SK100G (River Kilometer 58.01 in SFK-E), 2004 through 2007

Monthly summary of minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures in the South Fork Koktuli River at hydrology gage SK100G (River Kilometer 58.01 in SFK-E), 2004 through 2007

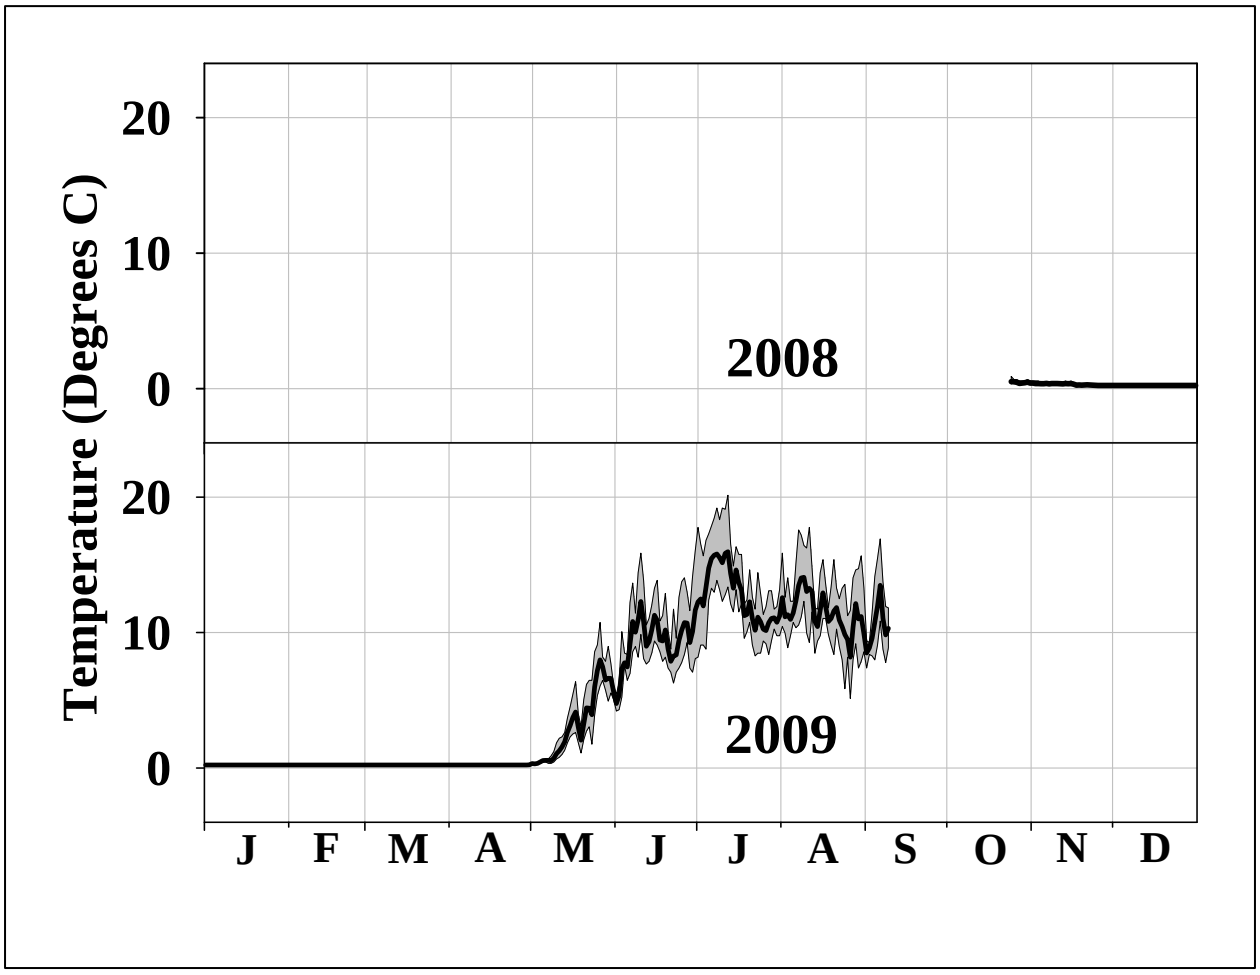
SOUTH FORK KOKTULI RIVER THERMOGRAPHS, 2008 AND 2009

Thermographs of Daily Maximum, Average, and Minimum Water Temperatures and Tables of Monthly Minimum Instantaneous, Minimum Daily, Monthly Average, Maximum Daily, and Maximum Instantaneous Water Temperatures at Hydrology and Water Temperature Monitoring Sites

Note: There are a couple of reasons for missing data gaps in this attachment. Missing data gaps occurred at some locations when the memory limit of the monitor was reached before there was an opportunity to safely retrieve the data. Data gaps at some gages occurred when the water surrounding the monitor froze.



Daily maximum, average, and minimum water temperatures in the South Fork Koktuli River at water temperature monitoring site SFK7WT (River Kilometer 54.67 in SFK-D), 2008 and 2009

Monthly summary of minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures in the South Fork Koktuli River at water temperature monitoring site SFK7WT (River Kilometer 54.67 in SFK-D), 2008 and 2009

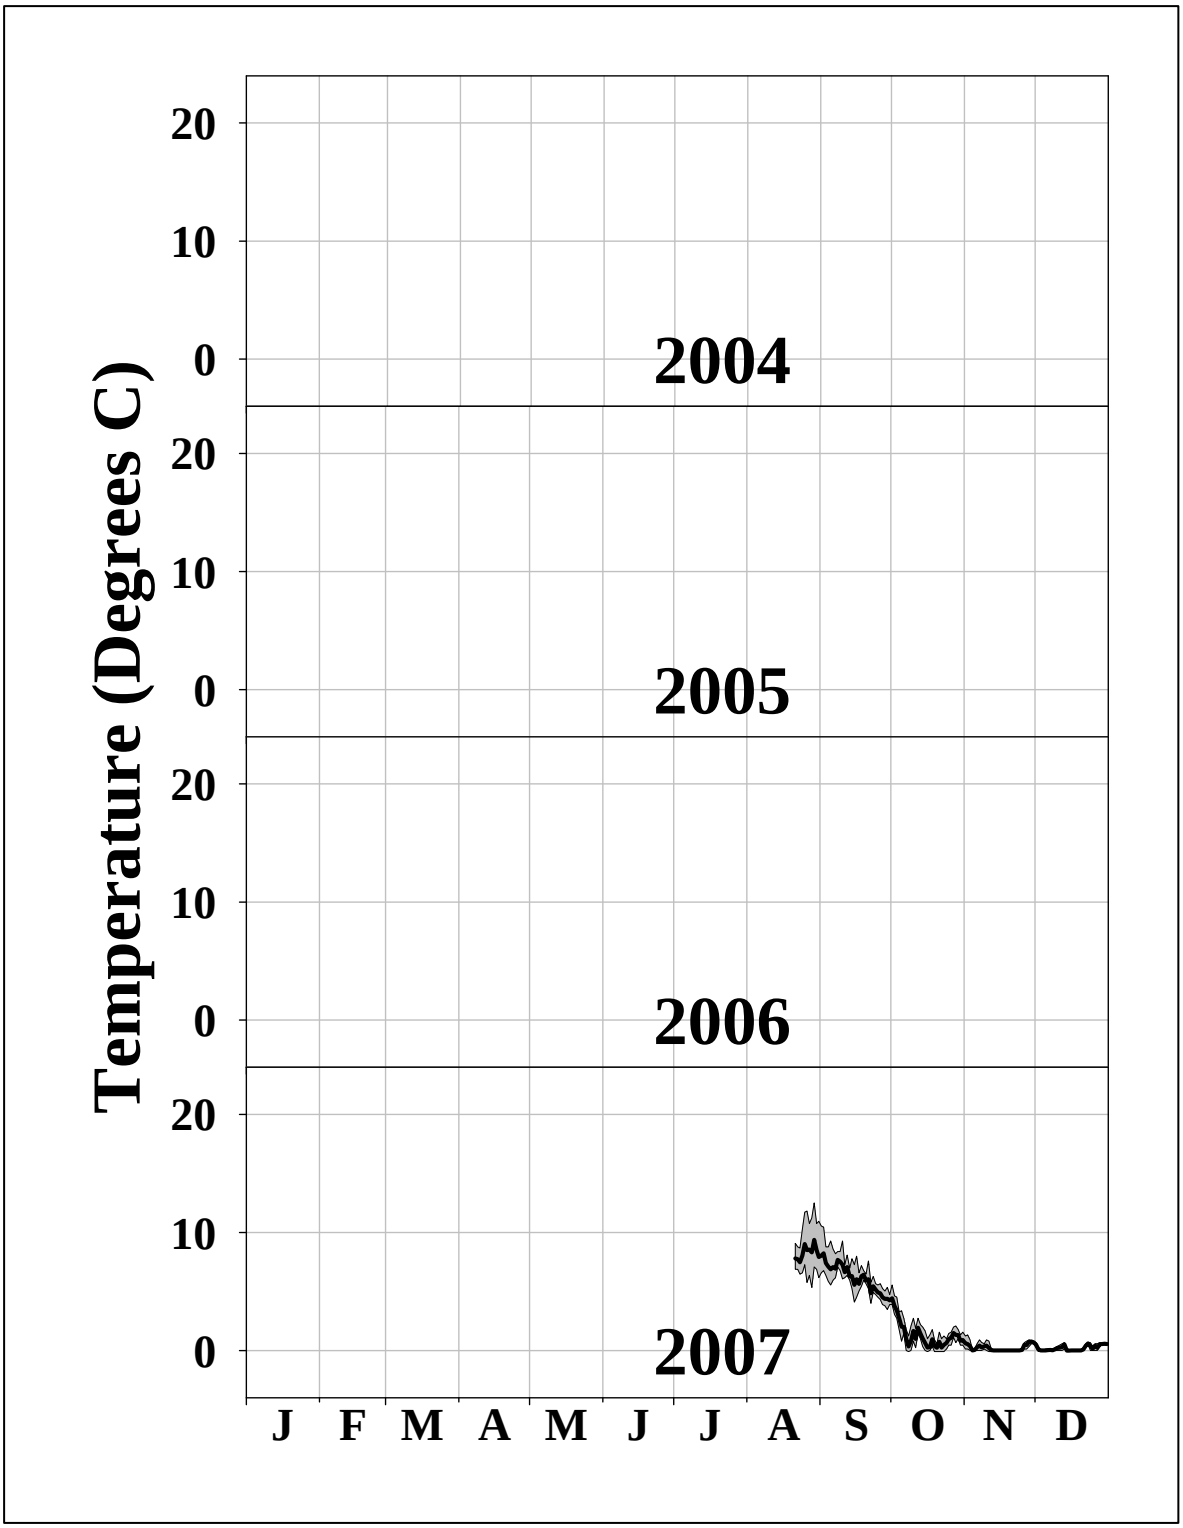
ATTACHMENT 3

NORTH FORK KOKTULI RIVER THERMOGRAPHS, 2004 THROUGH 2007

Thermographs of Daily Maximum, Average, and Minimum Water Temperatures and Tables of Monthly Minimum Instantaneous, Minimum Daily, Monthly Average, Maximum Daily, and Maximum Instantaneous Water Temperatures at Hydrology and Water Temperature Monitoring Sites

Note: There are several reasons for missing data gaps in this attachment. Hydrology gages (which are also used to measure temperature) are normally removed prior to winter freeze up, and reinstalled after the ice melts. Missing data gaps at other locations occurred when the memory limit of the monitor was reached before there was an opportunity to safely retrieve the data. Data gaps at some gages occurred when the water surrounding the monitor froze.



Daily maximum, average, and minimum water temperatures in the North Fork Koktuli River at water temperature monitoring site NFK9WT (River Kilometer 51.39 in NFK-E), in 2007

Monthly summary of minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures in the North Fork Koktuli River at water temperature monitoring site NFK9WT (River Kilometer 51.39 in NFK-E), in 2007

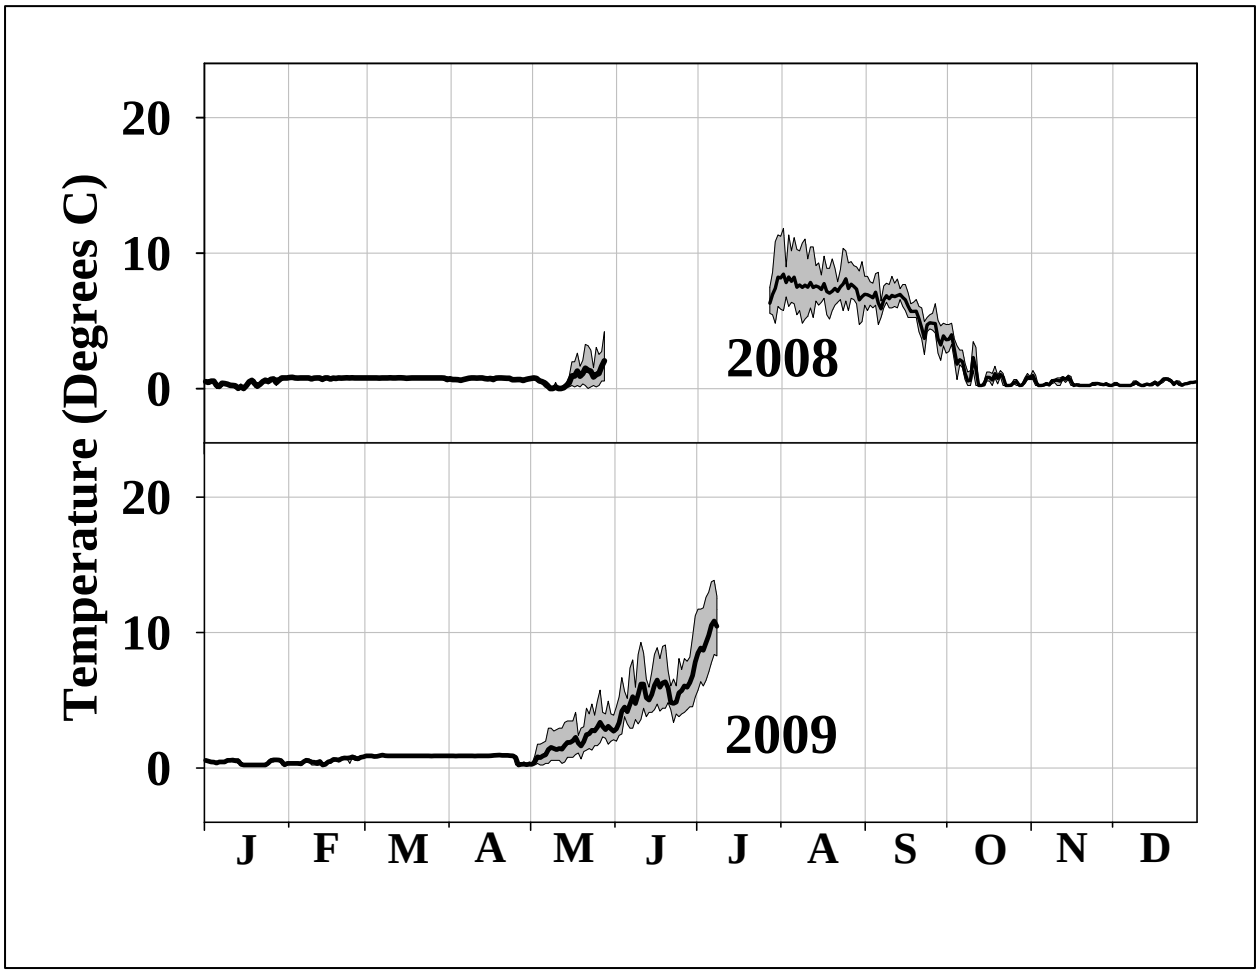
ATTACHMENT 4

NORTH FORK KOKTULI RIVER THERMOGRAPHS, 2008 AND 2009

Thermographs of Daily Maximum, Average, and Minimum Water Temperatures and Tables of Monthly Minimum Instantaneous, Minimum Daily, Monthly Average, Maximum Daily, and Maximum Instantaneous Water Temperatures at Hydrology and Water Temperature Monitoring Sites

Note: There are a couple of reasons for missing data gaps in this attachment. Missing data gaps occurred at some locations when the memory limit of the monitor was reached before there was an opportunity to safely retrieve the data. Data gaps at some gages occurred when the water surrounding the monitor froze.



Daily maximum, average, and minimum water temperatures in the North Fork Koktuli River at water temperature monitoring site NFK9WT (River Kilometer 51.39 in NFK-E), 2008 and 2009

Monthly summary of minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures in the North Fork Koktuli River at water temperature monitoring site NFK9WT (River Kilometer 51.39 in NFK-E), 2008 and 2009

Date		Water Temperature (degrees C)

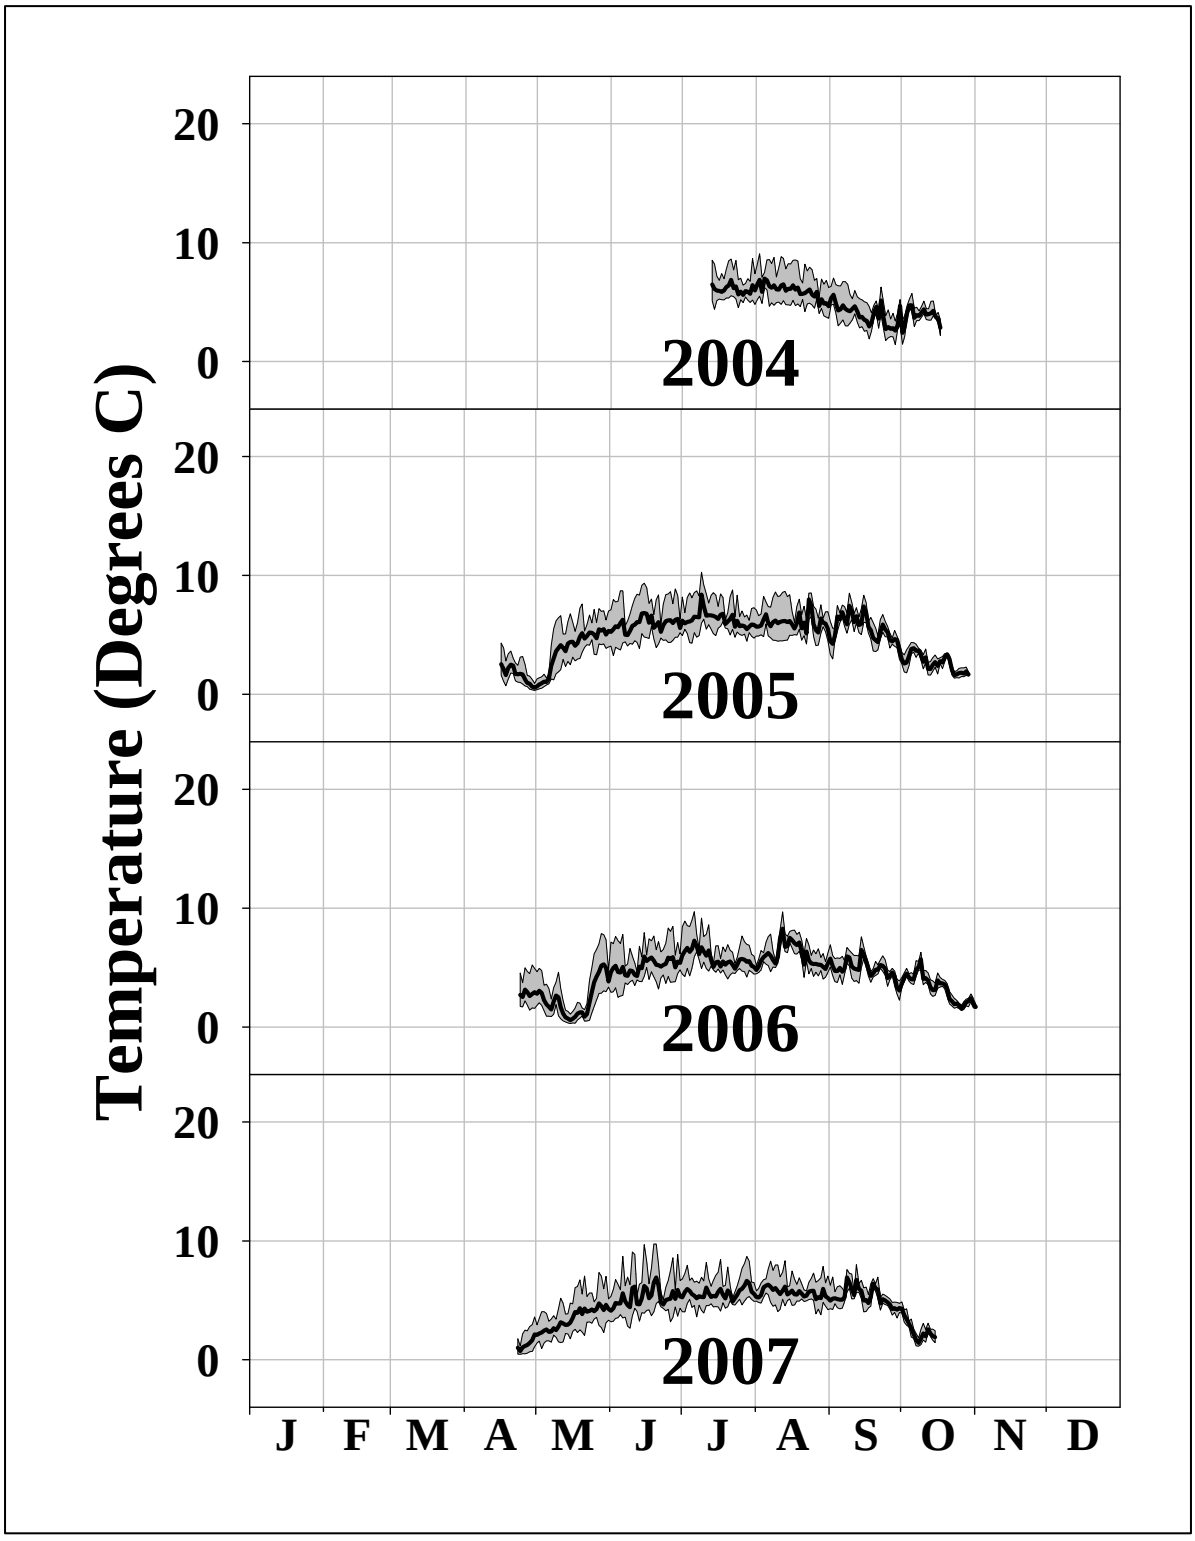
ATTACHMENT 5

UPPER TALARIK CREEK THERMOGRAPHS, 2004 THROUGH 2007

Thermographs of Daily Maximum, Average, and Minimum Water Temperatures and Tables of Monthly Minimum Instantaneous, Minimum Daily, Monthly Average, Maximum Daily, and Maximum Instantaneous Water Temperatures at Hydrology and Water Temperature Monitoring Sites

Note: There are several reasons for missing data gaps in this attachment. Hydrology gages (which are also used to measure temperature) are normally removed prior to winter freeze up, and reinstalled after the ice melts. Missing data gaps at other locations occurred when the memory limit of the monitor was reached before there was an opportunity to safely retrieve the data. Data gaps at some gages occurred when the water surrounding the monitor froze.



Daily maximum, average, and minimum water temperatures in Upper Talarik Creek at hydrology gage UT100E (River Kilometer 59.97 in UT-G), 2004 through 2007

Monthly summary of minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures in Upper Talarik Creek at hydrology gage UT100E (River Kilometer 59.97 in UT-G), 2004 through 2007

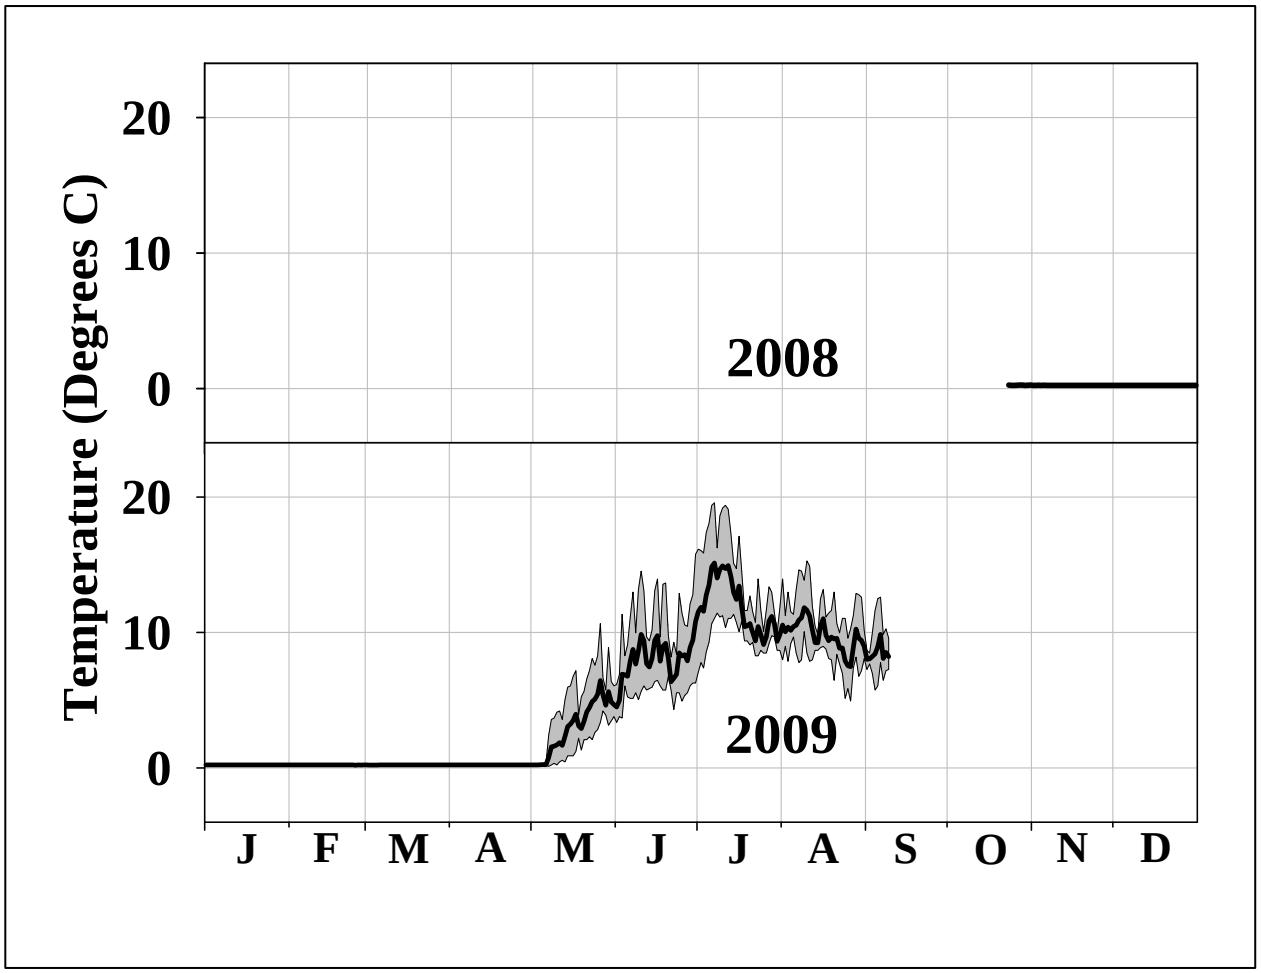
ATTACHMENT 6

UPPER TALARIK CREEK THERMOGRAPHS, 2008 AND 2009

Thermographs of Daily Maximum, Average, and Minimum Water Temperatures and Tables of Monthly Minimum Instantaneous, Minimum Daily, Monthly Average, Maximum Daily, and Maximum Instantaneous Water Temperatures at Hydrology and Water Temperature Monitoring Sites

Note: There are a couple of reasons for missing data gaps in this attachment. Missing data gaps occurred at some locations when the memory limit of the monitor was reached before there was an opportunity to safely retrieve the data. Data gaps at some gages occurred when the water surrounding the monitor froze.



Daily maximum, average, and minimum water temperatures in Upper Talarik Creek at water temperature monitoring site UT8WT (River Kilometer 51.62 in UT-F), 2008 and 2009

Monthly summary of minimum instantaneous, minimum daily, monthly average, maximum daily, and maximum instantaneous water temperatures in Upper Talarik Creek at water temperature monitoring site UT8WT (River Kilometer 51.62 in UT-F), 2008 and 2009

************************************** TABLE I: STREAM GEOMETRY AFTER 'M' NODES MERGED ****************************************
   BEGIN STREAM GEOMETRY VERIFICATION OF 'ADDCHG' PROGRAM. THE PURPOSE OF THIS PROGRAM IS TO:
      (1) ADD'M' NODES TO THE STREAM GEOMETRY ('KGNSTRG') FILE WHEN THE ELEVATION BETWEEN THE UPSTREAM & DOWNSTREAM SUBREACH
     NODES WOULD OTHERWISE EXCEED 300 METERS;
      (2) CALCULATE THE AVERAGE LATITUDES & ELEVATIONS FOR THE REACH;
      (3) CALCULATE THE STREAM GRADIENT & STREAMBED TEMPERATURE;
      (4) CREATE THE UNFORMATTED 'KSTRMGM' FILE.
THIS VERIFICATION IS THE FORMATTED VERSION OF 'KSTRMGM'.

********************************** TABLE III: STREAM GEOMETRY AFTER HYDROLOGY NODES MERGED ************************************
   BEGIN STREAM GEOMETRY VERIFICATION OF 'ADDHYD' PROGRAM. THE PURPOSE OF THIS PROGRAM IS TO:
      (1)MERGE THE HYDROLOGY ('D', 'K', 'P', 'Q', 'R', AND 'V') NODES FROM THE HYDROLOGY ('KGNSHDR') FILE WITH THE STREAM
          GEOMETRY ('KSTRMGM') FILE;
      (2) CREATE THE UNFORMATTED 'KSTRMGM' FILE.
THIS VERIFICATION IS THE FORMATTED VERSION OF THE 'KSTRMGM' FILE.

NORMAL COMPLETION OF 'HYDFIL'.

```
****************************************** TABLE V: HYDROLOGY WITH LATERAL FLOWS ADDED ******************************************
    BEGIN HYDROLOGY VERIFICATION OF 'LATFLO' PROGRAM. THE PURPOSE OF THIS PROGRAM IS:
       (1) COMPUTE LATERAL FLOWS FOR UPSTREAM NODES;
       (2) CREATE THE FINAL UNFORMATTED HYDROLOGY FILE.
 THIS VERIFICATION IS A FORMATTED VERSION OF THE 'KHYDR5' OR 'KHYDROL' FILE.
